## Introduction

The Fibonacci sequence with initial conditions $F_{0}=0$ and $F_{1}=1$ is defined recursively for $n>1$ as $F_{n}=F_{n-1}+F_{n-2}$.

$$
0,1,1,2,3,5,8,13,21,34,55, \ldots
$$

The order of appearance $z(n)$ for a natural $n$ is the smallest positive integer $\ell$ such that $n \mid F_{\ell}$.

| $n$ | 1 | 2 | 3 | 4 | 5 | 6 | 7 | 8 | 9 | 10 | 11 | 12 |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| $z(n)$ | 1 | 3 | 4 | 6 | 5 | 12 | 8 | 6 | 12 | 15 | 10 | 12 |

Table 1: The order of appearance $z(n)$

## Example

Let $n=4$. Then $z(4)=6$ and the $6^{\text {th }}$ Fibonacci number is 8 , which is the first Fibonacci that divides 4.

## Fixed Points

A fixed point in the Fibonacci sequence occurs when $z(n)=n$.

| $n$ | 1 | 2 | 3 | 4 | 5 | 6 | 7 | 8 | 9 | 10 | 11 | 12 |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| $z(n)$ | 1 | 3 | 4 | 6 | 5 | 12 | 8 | 6 | 12 | 15 | 10 | 12 |

Table 2: Highlighted values are fixed points

Theorem (Marques)
$z(n)=n$ if and only if $n=5^{k}$ or $n=12 \cdot 5^{k}$ for some $k \geq 0$.
The fixed point order $z^{k}(n)$ for a natural $n$ is the smallest positive integer $k$ such that $z^{k}(n)$ is a fixed point. If $n$ is a fixed point, the fixed point order is 0 .

## Fixed Point Order

| $n \backslash k$ | 1 | 2 | 3 | 4 |
| :---: | :---: | :---: | :---: | :---: |
| 1 | 1 |  |  |  |
| 2 | 3 | 4 | 6 | 12 |
| 3 | 4 | 6 | 12 |  |
| 4 | 6 | 12 |  |  |
| 5 | 5 |  |  |  |
| 6 | 12 |  |  |  |
| 7 | 8 | 6 | 12 |  |
| 8 | 6 | 12 |  |  |
| 9 | 12 |  |  |  |
| 10 | 15 | 20 | 30 | 60 |

Table 3: Iterations of $z$ on $n$, highlighted values are fixed points

## Infinitely Many Integers $k$-Steps Away

## Theorem (FMV)

For all positive integers $k$, there exist infinitely many $n$ with fixed point order $k$.

Lemma (FMV)
Suppose $z^{k}\left(5^{a} \cdot n\right)=c_{k} 5^{a_{i}}$, where $\operatorname{gcd}\left(c_{k}, 5\right)=1$. For all non-negative integers $a$, the coefficient $c_{k}$ remains constant.

Lemma (FMV)
For all integers $k$ and $m$ with $k \geq 0, m \geq 4$ and $2 k+2 \leq m$, we have

$$
z^{k}\left(10^{m}\right)=3 \cdot 5^{m} \cdot 2^{m-2 k} .
$$

## Lemma 1

## Lemma (FMV)

Suppose $z^{k}\left(5^{a} \cdot n\right)=c_{k} 5^{a_{i}}$, where $\operatorname{gcd}\left(c_{k}, 5\right)=1$. For all
non-negative integers $a$, the coefficient $c_{k}$ remains constant.
Example
Suppose $n=11$. Observe that

$$
\begin{gathered}
z(11)=10=10 \cdot 5^{0} \\
z(11 \cdot 5)=z(55)=10=10 \cdot 5^{0} \\
z\left(11 \cdot 5^{2}\right)=z(275)=50=10 \cdot 5^{1} \\
z\left(11 \cdot 5^{3}\right)=z(1375)=250=10 \cdot 5^{2}
\end{gathered}
$$

## Lemma 2

## Lemma (FMV)

For all integers $k$ and $m$ with $k \geq 0, m \geq 4$ and $2 k+2 \leq m$, we have

$$
z^{k}\left(10^{m}\right)=3 \cdot 5^{m} \cdot 2^{m-2 k}
$$

## Proof.

When $k=1$

$$
z\left(10^{m}\right)=\operatorname{lcm}\left(z\left(2^{m}\right), z\left(5^{m}\right)\right)=\operatorname{lcm}\left(3 \cdot 2^{m-2}, 5^{m}\right)=3 \cdot 5^{m} \cdot 2^{m-2}
$$

For $k>1$

$$
\begin{aligned}
z^{k+1}\left(10^{m}\right) & =z\left(z^{k}\left(10^{m}\right)\right) \\
& =\operatorname{lcm}\left(z(3), z\left(5^{m}\right), z\left(2^{m-2 k}\right)\right) \\
& =\operatorname{lcm}\left(4,5^{m}, 2^{m-2 k-2} \cdot 3\right)
\end{aligned}
$$

$$
=3 \cdot 5^{m} \cdot 2^{m-2(k+1)} \quad \text { since } m \geq 2(k+1)+2=2 k+4
$$

## Proof Sketch of Theorem

## Theorem (FMV)

For all positive integers $k$, there exist infinitely many $n$ with fixed point order $k$.

## Proof.

Let $r \in \mathbb{Z}_{>0}$ be arbitrary.
Case 1: $n$ goes to a fixed point of the form $5^{a}$ in $k$-steps. Then $z^{k-1}(n)=c \cdot 5^{b}$ for $c, b \in \mathbb{Z}_{>0}$. Applying Lemma 1, we know $5^{r} \cdot n$ exactly $k$ iterations to reach a fixed point.

Case 2: $n$ goes to a fixed point of the form $12 \cdot 5^{a}$ in $k$-steps. Then $z^{k-1}\left(5^{r} \cdot n\right)=c \cdot 5^{b}$ for $c, b \in \mathbb{Z}_{>0}$. Thus, $5^{r} \cdot n$ requires exactly $k$ iterations to reach a fixed point.

## Future Directions

1. Where are fixed points located when initial conditions are varied?
2. How does $z^{k}(n)$ behave for related sequences?

- e.g., Lucas numbers and Tribonacci sequence

3. For a given integer, can the fixed point order be bounded as a function of $n$ ?

| $k$ | 1 | 2 | 3 | 4 | 5 | 6 | 7 | 8 | 9 | 10 |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| $n$ | 1 | 4 | 3 | 2 | 11 | 89 | 1069 | 2137 | 4273 | 59833 |
| FP | 1 | 12 | 12 | 12 | 60 | 60 | 60 | 60 | 60 | 60 |

Table 4: First $n$ that takes $k$ iterations to reach a fixed point
