# Bridge Hands: Getting all cards

### Math 331: Fall 2024: sjm1@williams.edu

In bridge the 52 cards are dealt 13 to a player. How many deals are needed before a player expects to see each card at least once? (Question from Kayla Miller, a few hours after a hand where she had 6 trump in opposition to Cameron Miller's 6!)

```
in[*]:= dealstillseeall[numcards_, numdo_] := Module[{}},
      For[d = 1,
       d \le 80 * numcards * Log[8 * numcards], d++, numdeals[d] = 0];
       (* numdeals records how many deals of length
       d were there before a given person saw everything.
         estimating that do not need to go
       further than numcards * Log[4*numcards] * 4 *)
      deck = {};
      For [d = 1, d \le 4 * numcards, d++, deck = AppendTo[deck, d]];

## **THEORY**

Below is an approach to solve the problem through recurrences / iteratively finding. Some notation first:

s = number of suits

c = number of cards

p = number of players (often p = s)

h = number of cards in a hand (often h = c)

d = number of cards in the deck: d = h p = s c

The number of ways to choose a hand (order doesn't matter) is (d choose h)

Let x\_m be the wait when missing m cards (so have d-m cards seen)

The number of ways to choose a hand and get k of the m missing cards (so have d-m already) is (m choose k) (d - m choose h - k)

Note that (m choose -i) = 0 for any positive i, as is (m choose m+i)

```
In[@]:= recurrencetofindwaittime[suits_, cards_, players_, hands_] := Module[{},
       s = suits; c = cards; p = players; h = hands; d = s * c;
        (* x[m] is average weight time when missing m;
       we find recursively, start knowing x[0] = 0 and x[1] = 1/p,
       both from the formula and there are p hands! *)
        (* it is convenient to set y[i] =
        x[i] for i < m if trying to find x[m] and y[m] = 0 *)
        (* want y[m] = 0 from bringing things over to solve for x[m] *)
       For [i = 0, i \le d+1, i++,
         x[i] = 0; y[i] = 0; (* initialize quantities to zero *)
        }];
       x[1] = p; y[1] = x[1];
       numhands = Binomial[d, h]; (* number of ways to choose h cards from deck of d *)
       For [m = 2, m \le d, m++,
         x[m] = Sum[Binomial[m, k]Binomial[d-m, h-k] (y[m-k] + 1) / numhands,
             {k, 0, Min[h, m]}] / (1 - (Binomial[d - m, h] / numhands));
          (* this is the recursive formula, do only for k at most min(h,m) *)
         y[m] = x[m]; (* update y[m] from 0 to x[m] *)
         Print["Wait time x[", m, "] = ", 1.0 x[m], "."];
        }]; (* end of n loop *)
       Print["x[", m-1, "] = ", x[m-1]];
