Johnson  
Hamilton  
College

A **knot** is a closed curve embedded in three dimensions which is not self-intersecting. Of particular interest to us are the  $(p, q)$  torus knots, or  $T_{p,q}$ .

# Knots

College

A **knot** is a closed curve embedded in three dimensions which is not self-intersecting. Of particular interest to us are the  $(p, q)$  torus knots, or  $T_{p,q}$ .

## Definition

*Torus knots* lie on the unknotted torus. A  $(p, q)$  torus knot winds around the axis of revolution  $p$  times and wraps around the core of the torus  $q$  times.

A **knot** is a closed curve embedded in three dimensions which is not self-intersecting. Of particular interest to us are the  $(p, q)$  torus knots, or  $T_{p,q}$ .

## Definition

*Torus knots* lie on the unknotted torus. A  $(p, q)$  torus knot winds around the axis of revolution  $p$  times and wraps around the core of the torus  $q$  times.

We will deal particularly with the class of torus knots  $T_{p-1,p}$ .

# Knot Invariants

- *Crossing Number*: Fewest number of crossings in any projection of the knot.  $c(T_{2,3}) = 3$ .

# Graph Theory

Ramsey  
Number and  
Other Knot  
Invariants

Maribeth  
Johnson  
Hamilton  
College

A **graph** is a set of vertices connected by edges. A **complete graph** on  $n$  vertices is a set of  $n$  vertices such that each pair of vertices is connected by an edge. A **Hamiltonian cycle** of a graph is a cycle which visits every vertex exactly once.

A **graph** is a set of vertices connected by edges. A **complete graph** on  $n$  vertices is a set of  $n$  vertices such that each pair of vertices is connected by an edge. A **Hamiltonian cycle** of a graph is a cycle which visits every vertex exactly once.

## Definition

A **linear spatial embedding** of  $K_n$  is a copy of  $K_n$  in 3-space such that every edge is straight and no two edges intersect one another.

College

## Definition

The **Ramsey number** of a knot is the smallest  $n$  such that any linear spatial embedding of  $K_n$  contains the knot  $K$ .

Negami [5] proved  $R(K)$  is finite for any knot  $K$ .

It is known  $R(\text{unknot}) = 3$ .

Ramírez Alfonsín [1] proved  $R(T_{2,3}) = 7$ .

Based on moves defined by Cromwell [2].

Arc Merge:

# Bridge Number of a Hamiltonian Cycle

Ramsey  
Number and  
Other Knot  
Invariants

Maribeth  
Johnson  
Hamilton  
College

Remember that the bridge number of a knot is the minimum number of maxima in any projection.

# Bridge Number of a Hamiltonian Cycle

Ramsey  
Number and  
Other Knot  
Invariants

Maribeth  
Johnson  
Hamilton  
College

Remember that the bridge number of a knot is the minimum number of maxima in any projection.

## Definition

The *bridge number of a Hamiltonian cycle*, denoted  $b(H)$  is the number of maxima in the projection of the cycle in  $C_n$ .

# Bridge Number of a Hamiltonian Cycle

Remember that the bridge number of a knot is the minimum number of maxima in any projection.

## Definition

The *bridge number* of a Hamiltonian cycle, denoted  $b(H)$  is the number of maxima in the projection of the cycle in  $C_n$ .

# Reducing Arc Presentations

College

## Lemma

*For a knot  $K$ , corresponding to a Hamiltonian cycle of  $C_n$ ,  
 $\alpha(K) + b(H) \leq n$ .*

## Proof.

Note that a maximum can be reduced by an arc merge, so we can always perform  $b(H)$  arc merges, showing  $\alpha(K) \leq n - b(H)$ , or  $\alpha(K) + b(H) \leq n$ . □

# Application to Ramsey Number

## Theorem

*For any knot  $K$ ,  $\alpha(K) + br(K) \leq R(K)$ .*

## Proof.

Note that since for any knotted cycle of  $C_n$   $b(H) \geq br(K)$ , our previous result implies that for  $K$  corresponding to  $H$  of  $C_n$ ,  $\alpha(K) + br(K) \leq n$ . Since  $K$  lives on  $C_{R(K)}$  by definition of Ramsey number, it follows that  $\alpha(K) + br(K) \leq R(K)$ .  $\square$

# Application to Ramsey Number

## Corollary

$$R(T_{p-1,p}) \geq 3p - 2.$$

## Proof.

Our theorem gives us that

$R(T_{p-1,p}) \geq \alpha(T_{p-1,p}) + br(T_{p-1,p})$ . An application of work by Schubert [6] shows  $br(T_{p-1,p}) = p - 1$ , and an application of work by Matsuda [4] shows us  $\alpha(T_{p-1,p}) = 2p - 1$ . Combining these results we find  $R(T_{p-1,p}) \geq 3p - 2$ . □

# Application to Ramsey Number

## Corollary

$$R(T_{p-1,p}) - s(T_{p-1,p}) \geq p - 2.$$

## Proof.

We just showed  $R(T_{p-1,p}) \geq 3p - 2$ . An application of a theorem by Jin [3] gives us that  $s(T_{p-1,p}) = 2p$ . Combining these results,  $R(T_{p-1,p}) - s(T_{p-1,p}) \geq p - 2$ . □

# Open Questions

Ramsey  
Number and  
Other Knot  
Invariants

Maribeth  
Johnson  
Hamilton  
College

- 1 Can we find other classes of knots for which the difference between the Ramsey number and stick number grows without bound?

# Open Questions

Ramsey  
Number and  
Other Knot  
Invariants

Maribeth  
Johnson  
Hamilton  
College

- 1 Can we find other classes of knots for which the difference between the Ramsey number and stick number grows without bound?
- 2 We have shown that the difference between Ramsey number and stick number of  $T_{p-1,p}$  is at least linear. Is it, in actuality, approximately linear? Quadratic? How can we best model this difference?

# Open Questions
