

What lurks beneath the folds?

The mathematics of folding on a grid

Ben MacDonald, Massachusetts Academy of Math and Science at WPI
Professor Cristina Ballantine, College of the Holy Cross

History

Some Terminology

- Stack
- Point of View of the Folder
- Fold
- Step
- Cell Sequence
- Fold Sequence
- Family

$2^{n-i} \times 2^{n-i} \times 4^i$ for $n = 2$ and $i = 0$

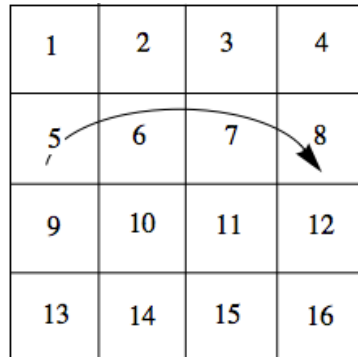

1α	2α	3α	4α
5α	6α	7α	8α
9α	10α	11α	12α
13α	14α	15α	16α

Influence of Grid Size

n	Permutations $(4^n)!$	Sequences 32^n	Distinct Sequences 16^n	Families 2^{4n-2}
0	1	1	1	0.25
1	24	32	16	4
2	2.09E+13	1024	256	64
3	1.27E+89	32768	4096	1024

Vertical Folds

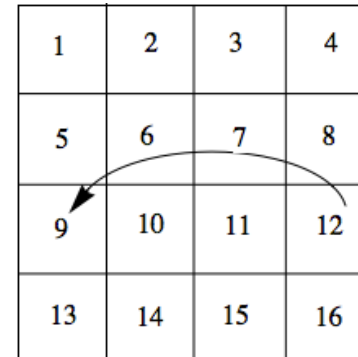

1	2	3	4
5	6	7	8
9	10	11	12
13	14	15	16

A 4x4 grid with cells numbered 1 to 16. A curved arrow originates from cell 5 and points to cell 8, indicating a fold from left to right.

L+

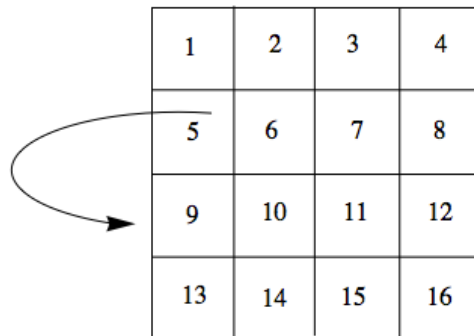

1	2	3	4
5	6	7	8
9	10	11	12
13	14	15	16

A 4x4 grid with cells numbered 1 to 16. A curved arrow originates from cell 8 and points to cell 9, indicating a fold from right to left.

R+

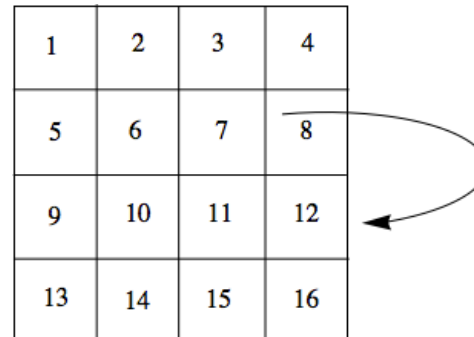

1	2	3	4
5	6	7	8
9	10	11	12
13	14	15	16

A 4x4 grid with cells numbered 1 to 16. A curved arrow originates from the left edge of the grid and points to cell 5, indicating a fold from the left edge towards the center.

L-

1	2	3	4
5	6	7	8
9	10	11	12
13	14	15	16

A 4x4 grid with cells numbered 1 to 16. A curved arrow originates from the right edge of the grid and points to cell 8, indicating a fold from the right edge towards the center.

B-

Horizontal Folds

1	2	3	4
5	6	7	8
9	10	11	12
13	14	15	16

T+

1	2	3	4
5	6	7	8
9	10	11	12
13	14	15	16

B+

1	2	3	4
5	6	7	8
9	10	11	12
13	14	15	16

T-

1	2	3	4
5	6	7	8
9	10	11	12
13	14	15	16

Some Terminology

- Stack
- Point of View of the Folder
- Fold
- Step
- Cell Sequence
- Fold Sequence
- Family

Fold Sequences by Family for $n = 1$

$n = 1$		
Fold Sequence	Fold Sequence	Final Cell Sequence
L+T+	R+B-	2 β , 1 α , 3 β , 4 α
L+B+	R+T-	4 β , 3 α , 1 β , 2 α
L-T-	R-B+	4 α , 3 β , 1 α , 2 β
L-B-	R-T+	2 α , 1 β , 3 α , 4 β
L+B-	R+T+	1 β , 2 α , 4 β , 3 α
L+T-	R+B+	3 β , 4 α , 2 β , 1 α
L-B+	R-T-	3 α , 4 β , 2 α , 1 β
L-T+	R-B-	1 α , 2 β , 4 α , 3 β
T+L+	B+L-	3 β , 2 α , 1 β , 3 α
T+R+	B+R-	4 β , 1 α , 2 β , 4 α
T-R+	B-L-	4 α , 2 β , 1 α , 3 β
T-L+	B-R-	3 α , 1 β , 2 α , 4 β
T+L-	B+R+	2 β , 4 α , 3 β , 1 α
T+R-	B+L+	1 β , 3 α , 4 β , 2 α
T-R-	B-L+	1 α , 3 β , 4 α , 2 β
T-L-	B-R+	2 α , 4 β , 3 α , 1 β

Transformations

- Sequence Preserving Transformations
- Sequence Reversing Transformations
- α/β Reversing Transformations
- Numerical Reversing Transformations
- Composition Rules

Sequence Preserving Transformations

$n = 1$		
Fold Sequence	Fold Sequence	Final Cell Sequence
L+T+	R+B-	$2\beta, 1\alpha, 3\beta, 4\alpha$

Sequence Reversing Transformations

$n = 1$		
Fold Sequence	Fold Sequence	Final Cell Sequence
L+T+	R+B-	$2\beta, 1\alpha, 3\beta, 4\alpha$
L-T-	R-B+	$4\alpha, 3\beta, 1\alpha, 2\beta$

$$L+T+ \xleftrightarrow{\text{SCSC}} L-T-$$

α/β Reversing Transformations

$n = 1$		
Fold Sequence	Fold Sequence	Final Cell Sequence
L+T+	R+B-	2 β , 1 α , 3 β , 4 α
L-B-	R-T+	2 α , 1 β , 3 α , 4 β

$$L+T+ \xleftrightarrow{\text{SCCC}} L-B-$$

Numerical Reversing Transformations

$n = 1$		
Fold Sequence	Fold Sequence	Final Cell Sequence
L+T+	R+B-	2 β , 1 α , 3 β , 4 α
L+B+	R+T-	4 β , 3 α , 1 β , 2 α

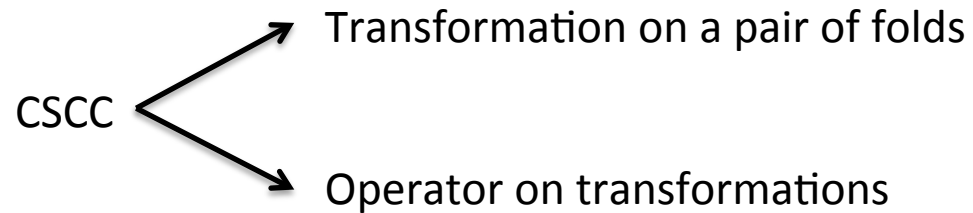

Composing Transformations

$$\begin{array}{r} \text{CSCC} \circ \text{SCCC} = \text{CCSS} \\ \begin{array}{r} \text{C} \text{ S} \text{ C} \text{ C} \\ + \text{S} \text{ C} \text{ C} \text{ C} \\ \hline \text{C} \text{ C} \text{ S} \text{ S} \end{array} \end{array}$$

- is commutative!
- binary addition

Applications

- Stacked computer chips
- Solar panels (space)
- Encryption
- Air bags
- Threading/computers

Properties

- P1. The grid, or piece of paper A , is a stack with dimensions $2^{n-i} \times 2^{n-i} \times 4^i$.
- P2. For any given n , the number of folds performed to transform the piece of paper into a final stack will be $2n$.
- P3. When a grid has been completely folded into a final stack, $i = n$.

Properties

P4. For all n , there exist eight possible first folds and four possible second folds for each step.

P5. Applying one step (which is two folds, one across each axis) to A will increment the index i by one and restore the front face of the grid to a square.

Properties

P6. The fold sequence is a sequence of length $2n$ where each pair of elements consists of one element from the set $\{L+, L-, R+, R-\}$ and another element from the set $\{T+, T-, B+, B-\}$. It doesn't matter which set is selected from first.

P7. The same sequence can result from multiple folding sequences.

Theorems

- T1. For any n , folding the grid allows for a total of 32^n sequences to be generated.
- T2. The α and β for any final cell sequence will always be alternating.
- T3. A final stack can start with either α or β and the very first fold determines the α/β sequence.

Theorems

T4. For any n , there are 2^n ways to generate a distinct sequence. This also means that there are 16^n distinct sequences.

T5. For any n , there exist 2^{4n-2} possible families.

T6. For $n=1$, every member of a family starts with either $\{L, R\}$ or $\{T, B\}$. In other words, all fold sequences of a family are generated by an initial fold that is always over the same axis.

Theorems

T4. For any n , there are 2^n ways to generate a distinct sequence. This also means that there are 16^n distinct sequences.

T5. For any n , there exist 2^{4n-2} possible families.

T6. For $n=1$, every member of a family starts with either $\{L, R\}$ or $\{T, B\}$. In other words, all fold sequences of a family are generated by an initial fold that is always over the same axis.

Theorems

T7. For $n=1$, pairs of fold sequences related by the transformation CSCC generate identical final cell sequences.

T8. For $n=1$, pairs of fold sequences related by the transformation SCCC generate two final cell sequences that have the same cell number ordering but have swapped α and β . In other words, the cell number ordering is preserved whereas the α/β sequence is reversed.

Theorems

T9. For $n=1$, pairs of fold sequences related by the transformation SSCS generate two final cell sequences that have the same α/β sequence but the cell number ordering is reversed. In other words, α/β sequence is preserved whereas the cell number ordering is reversed.

T10. For $n=1$, pairs of fold sequences related by the transformation SCSC generate two final cell sequences that have the reversed α/β sequence and the cell number ordering is reversed. In other words, the α/β sequence and the cell numbering order are reversed.

Theorems

T11. The results of applying multiple transformations to a fold sequence follow the addition properties described on the next slide.
