Polymath Ir			

### https://geometrynyc.wixsite.com/polymathreu

Our goal is to provide research opportunities to every undergraduate who wishes to explore advanced mathematics. This online program consists of research projects in a variety of mathematical topics and runs in the spirit of the Polymath Project. Each project is mentored by an active researcher with experience in undergraduate mentoring.

Each project consists of 15-25 undergraduates, a main mentor, and graduate students and postdocs as additional mentors. The group works towards solving a research problem and writing a paper. Each participant decides what they wish to obtain from the program, and participates accordingly. The program is partially supported by NSF award DMS-2218374.

Let A be a finite set of nonnegative integers, with |A| its size.

### Definition

The sumset A + A and difference set A - A of A are

$$A + A = \{a_i + a_j : a_i, a_j \in A\},\$$
$$A - A = \{a_i - a_j : a_i, a_j \in A\}.$$

▲ロ ▶ ▲周 ▶ ▲ 国 ▶ ▲ 国 ▶ ● の Q @

Let A be a finite set of nonnegative integers, with |A| its size.

#### Definition

The sumset A + A and difference set A - A of A are

$$A + A = \{a_i + a_j : a_i, a_j \in A\},\$$
$$A - A = \{a_i - a_j : a_i, a_j \in A\}.$$

Expect a generic A has  $|A - A| \ge |A + A|$ , as addition commutes while subtraction doesn't.

▲□▶ ▲□▶ ▲三▶ ▲三▶ 三三 のへの

Let A be a finite set of nonnegative integers, with |A| its size.

#### Definition

The sumset A + A and difference set A - A of A are

$$A + A = \{a_i + a_j : a_i, a_j \in A\},\$$
$$A - A = \{a_i - a_j : a_i, a_j \in A\}.$$

Expect a generic A has  $|A - A| \ge |A + A|$ , as addition commutes while subtraction doesn't.

#### Definition

Say A is sum-dominated if |A + A| > |A - A|, difference-dominated if |A - A| > |A + A| and balanced otherwise. Background 00●0000 Main Results

# Existence of Sum-Dominated Sets

#### Question

Do there exist sum-dominated sets?

Conway:  $\{0, 2, 3, 4, 7, 11, 12, 14\}$  is sum-dominated.

Hegarty, Nathanson...: Infinite families of sum-dominated sets.

▲□▶ ▲□▶ ▲□▶ ▲□▶ □ のQで

# Existence of Sum-Dominated Sets

#### Question

Do there exist sum-dominated sets?

Conway: {0, 2, 3, 4, 7, 11, 12, 14} is sum-dominated. Hegarty, Nathanson...: Infinite families of sum-dominated sets.

"Even though there exist sets A that have more sums than differences, such sets should be rare, and it must be true with the right way of counting that the vast majority of sets satisfies |A - A| > |A + A|." - Melvyn B. Nathanson, 2006.

▲□▶ ▲□▶ ▲□▶ ▲□▶ □ のQで

# Existence of Sum-Dominated Sets

#### Question

Do there exist sum-dominated sets?

Conway: {0, 2, 3, 4, 7, 11, 12, 14} is sum-dominated. Hegarty, Nathanson...: Infinite families of sum-dominated sets.

"Even though there exist sets A that have more sums than differences, such sets should be rare, and it must be true with the right way of counting that the vast majority of sets satisfies |A - A| > |A + A|." - Melvyn B. Nathanson, 2006.

#### Question

What is the "right way of counting"?

 $\begin{array}{c|c} \begin{array}{ccc} \text{Background} & \text{Main Results} & \text{Proof Overview} & \text{Open Directions} \\ \hline \\ \text{Uniform Subset Model on } I_N := \{0, 1, \dots, N-1\} \end{array}$ 

**Interpretation:** Find a natural family of probability measures  $\{\mathbb{P}_N\}_{N=1}^{\infty}$  on  $2^{I_N}$  where

$$\lim_{N\to\infty}\mathbb{P}_N\left(\{A\subseteq I_N:A \text{ is } \mathsf{MSTD}\}\right)=0.$$

▲□▶ ▲□▶ ▲□▶ ▲□▶ ▲□ ● ● ●

 $\begin{array}{c|c} \begin{array}{c} \text{Background} \\ \text{ood} \end{array} & \begin{array}{c} \text{Main Results} \\ \text{ood} \end{array} & \begin{array}{c} \text{Proof Overview} \\ \text{ood} \end{array} & \begin{array}{c} \text{Open Directions} \end{array} \\ \end{array} \\ \begin{array}{c} \text{Uniform Subset Model on } I_N := \{0, 1, \dots, N-1\} \end{array}$ 

**Interpretation:** Find a natural family of probability measures  $\{\mathbb{P}_N\}_{N=1}^{\infty}$  on  $2^{I_N}$  where

$$\lim_{N\to\infty}\mathbb{P}_N\left(\{A\subseteq I_N:A \text{ is MSTD}\}\right)=0.$$

**First try:** Pick A uniformly at random from  $2^{I_N}$  (i.e., independently  $k \in I_N$  in A with probability 1/2).

 $\begin{array}{c|c} \begin{array}{ccc} \text{Background} & \text{Main Results} & \text{Proof Overview} & \text{Open Directions} \\ \hline \\ \text{Uniform Subset Model on } I_N := \{0, 1, \dots, N-1\} \end{array}$ 

**Interpretation:** Find a natural family of probability measures  $\{\mathbb{P}_N\}_{N=1}^{\infty}$  on  $2^{I_N}$  where

$$\lim_{N\to\infty}\mathbb{P}_N\left(\{A\subseteq I_N:A \text{ is } \mathsf{MSTD}\}\right)=0.$$

**First try:** Pick A uniformly at random from  $2^{I_N}$  (i.e., independently  $k \in I_N$  in A with probability 1/2).

I

 $\begin{array}{c|c} \begin{array}{c} \text{Background} \\ \text{ood} \end{array} & \begin{array}{c} \text{Main Results} \\ \text{ood} \end{array} & \begin{array}{c} \text{Proof Overview} \\ \text{ood} \end{array} & \begin{array}{c} \text{Open Directions} \end{array} \\ \end{array} \\ \begin{array}{c} \text{Uniform Subset Model on } I_N := \{0, 1, \dots, N-1\} \end{array}$ 

Interpretation: Find a natural family of probability measures  $\{\mathbb{P}_N\}_{N=1}^\infty$  on  $2^{I_N}$  where

$$\lim_{N\to\infty}\mathbb{P}_N\left(\{A\subseteq I_N:A \text{ is } \mathsf{MSTD}\}\right)=0.$$

**First try:** Pick A uniformly at random from  $2^{I_N}$  (i.e., independently  $k \in I_N$  in A with probability 1/2).

Theorem (Martin and O'Bryant, 2006)  $\lim_{N\to\infty} \frac{\#\{A \subseteq I_N : A \text{ is } MSTD\}}{2^{N+1}} > c_{1/2} > 0.$ 

## Intuition:

I

With high probability, A + A and A - A hits everything in the middle of [0, 2N] and [-N, N], respectively.

 $\begin{array}{c|c} \begin{array}{c} \text{Background} \\ \text{ood} \end{array} & \begin{array}{c} \text{Main Results} \\ \text{ood} \end{array} & \begin{array}{c} \text{Proof Overview} \\ \text{ood} \end{array} & \begin{array}{c} \text{Open Directions} \end{array} \\ \end{array} \\ \begin{array}{c} \text{Uniform Subset Model on } I_N := \{0, 1, \dots, N-1\} \end{array}$ 

Interpretation: Find a natural family of probability measures  $\{\mathbb{P}_N\}_{N=1}^\infty$  on  $2^{I_N}$  where

$$\lim_{N\to\infty}\mathbb{P}_N\left(\{A\subseteq I_N:A \text{ is } \mathsf{MSTD}\}\right)=0.$$

**First try:** Pick A uniformly at random from  $2^{I_N}$  (i.e., independently  $k \in I_N$  in A with probability 1/2).

Theorem (Martin and O'Bryant, 2006)  $\lim_{N\to\infty} \frac{\#\{A \subseteq I_N : A \text{ is } MSTD\}}{2^{N+1}} > c_{1/2} > 0.$ 

## Intuition:

I

- With high probability, A + A and A − A hits everything in the middle of [0, 2N] and [−N, N], respectively.
- "Rig" fringes of A + A and A A by selecting the fringes of A.

 $\begin{array}{c|c} \begin{array}{ccc} \text{Background} & \text{Main Results} & \text{Proof Overview} & \text{Open Directions} \\ \hline \\ \text{Uniform Subset Model on } I_N := \{0, 1, \dots, N-1\} \end{array}$ 

Interpretation: Find a natural family of probability measures  $\{\mathbb{P}_N\}_{N=1}^\infty$  on  $2^{I_N}$  where

$$\lim_{N\to\infty}\mathbb{P}_N\left(\{A\subseteq I_N:A \text{ is } \mathsf{MSTD}\}\right)=0.$$

**First try:** Pick A uniformly at random from  $2^{I_N}$  (i.e., independently  $k \in I_N$  in A with probability 1/2).

Theorem (Martin and O'Bryant, 2006)  $\lim_{N \to \infty} \frac{\#\{A \subseteq I_N : A \text{ is } MSTD\}}{2^{N+1}} > c_{1/2} > 0.$ 

## Intuition:

I

With high probability, A + A and A - A hits everything in the middle of [0, 2N] and [-N, N], respectively.

• "Rig" fringes of A + A and A - A by selecting the fringes of A. Uniform subset model might not be the "right way of counting."

**Second try:** Similar, but the inclusion probability for taking k is p(N) = o(1) and  $N \cdot p(N) \gg 1$ . Assume this from now on.

▲□▶ ▲□▶ ▲□▶ ▲□▶ ▲□ ● ● ●

Inclusion probability to 0, while |A + A|, |A - A| grow.

**Second try:** Similar, but the inclusion probability for taking k is p(N) = o(1) and  $N \cdot p(N) \gg 1$ . Assume this from now on.

Inclusion probability to 0, while |A + A|, |A - A| grow.

Conjecture (Martin and O'Bryant, 2006)

Under the binomial model, A is not MSTD with high probability.

**Second try:** Similar, but the inclusion probability for taking k is p(N) = o(1) and  $N \cdot p(N) \gg 1$ . Assume this from now on.

Inclusion probability to 0, while |A + A|, |A - A| grow.

Conjecture (Martin and O'Bryant, 2006)

Under the binomial model, A is not MSTD with high probability.

Theorem (Hegarty and Miller, 2008)

Let  $1/N \ll p(N) = 0(1)$ .

• If 
$$p(N) = o(N^{-1/2})$$
:  $|A - A| \sim 2|A + A| \sim (N \cdot p(N))^2$ .

Background Soo Binomial Model: Phase Transition

**Second try:** Similar, but the inclusion probability for taking k is p(N) = o(1) and  $N \cdot p(N) \gg 1$ . Assume this from now on.

Inclusion probability to 0, while |A + A|, |A - A| grow.

Conjecture (Martin and O'Bryant, 2006)

Under the binomial model, A is not MSTD with high probability.

#### Theorem (Hegarty and Miller, 2008)

Let 
$$1/N \ll p(N) = 0(1)$$
.  
• If  $p(N) = o(N^{-1/2})$ :  $|A - A| \sim 2|A + A| \sim (N \cdot p(N))^2$ .  
• If  $p(N) = cN^{-1/2}$ :  $|A + A| \sim g(c^2/2)N$  and  $|A - A| \sim g(c^2)N$  with  $g(c) = 2(e^{-x} - 1 - x)/x$ .

**Follow-Up Question:** Say that *L* takes values in  $[-d_L N, s_L N]$ . Is there something more interesting to be said about weak Poisson convergence?

Theorem (Jeong, Miller, 2023+)

Fix a candidate value  $k \in [-d_L N, s_L N]$  of L(A). Let  $W_k$  denote the number of distinct ways to represent k in L(A). Let  $\mu_k = \mathbb{E}[W_k]$ . Let C > 0 be a constant.

 Main Result 2: Local Phase Transition

**Key Tool:** Stein's method based on dependency graphs to estimate zero probabilities of the number of distinct ways that a value under L(A) is achieved.

**Follow-Up Question:** Say that *L* takes values in  $[-d_L N, s_L N]$ . Is there something more interesting to be said about weak Poisson convergence?

Theorem (Jeong, Miller, 2023+)

Fix a candidate value  $k \in [-d_L N, s_L N]$  of L(A). Let  $W_k$  denote the number of distinct ways to represent k in L(A). Let  $\mu_k = \mathbb{E}[W_k]$ . Let C > 0 be a constant.

**Upshot:** This threshold  $N^{-\frac{h-2}{h-1}}$  here dominates the previous threshold  $N^{-\frac{h-1}{h}}$ . Thus, "de-Poissonization" does not explain the global phase transition of L(A).

**Aside:** In MSTD literature, number of representations of k captured by graphs on vertices [N] and edges corresponding to representations. Can express the above theorem as a threshold result on a certain random h-regular hypergraph.

◆□▶ ◆□▶ ◆三▶ ◆三▶ 三三 のへぐ

- **1** Asymptotic enumeration
- **②** Stein's method and Janson inequalities
- **③** Kim–Vu martingale machinery

 Asymptotic enumeration: Derive asymptotic formulae for the number of distinct representations for a candidate value k ∈ [-d<sub>L</sub>N, s<sub>L</sub>N] in L(A).

With some work, this can be reduced to computing the number of partitions of *k* into *h* parts, for which the generating function is well-known to be the Gaussian binomial coefficient  $\binom{k+h}{h}_{q}$ .

Recent analytic result on partition enumeration from Stanley and Zanello gives uniform asymptotics on the coefficients of  $\binom{k+h}{h}_q$  for **fixed** *h* (previous known results held for  $h \nearrow \infty$ ).

- Stein's method and Janson inequalities
- **③** Kim–Vu martingale machinery

Stein's method and Janson inequalities: The possible ways in which a candidate sum  $-d_LN + k$  may be generated in L(A) correspond to a collection of rare and weakly dependent events.

**Critical window:** Use the Stein-Chen method based on dependency graphs to get sharp estimates for zero probabilities for the number of representations in L(A).

**Supercritical regime:** Use Janson's inequalities to get vanishing bounds on zero probabilities for the number of representations in L(A). Aggregate these approximations to argue that most everything is hit.

Sim–Vu martingale machinery

Background 0000000	Main Results 00	Proof Overview	Open Directions
Main Ingredients	s in the Proof		

- **1** Asymptotic enumeration
- **2** Stein's method and Janson inequalities
- Kim-Vu martingale machinery: The second moment method fails to guarantee strong concentration bounds. We instead use Kim-Vu martingales to promote moment estimates to high-probability results.

Future Work			

## Generalizations

- Integer lattice: Can we extend this to the integer lattice  $\mathbb{Z}^d$  on *d* dimensions, or to other lattices?
- **Other groups:** What if we change the ambient group that we work on?
- Nonlinearity: What happens if *L* is a higher-degree polynomial (e.g.,  $L(x_1, x_2) = x_1^2 + x_2$ )? Our work settles the degree-1 regime. Do phase transitions persist?

• Additional dependency: What changes if we introduce dependencies into the binomial model itself, rather than modifying the context under which it operates?

- **2** Extending weak convergence results
  - Joint Poisson limit: Can one describe the joint distribution of *L*(*A*) candidate values, not just marginals?
  - **Point processes:** Is there a local point process limit of some sort?
