# When Almost All Sets Are Difference Dominated

Steven J Miller Williams College

Steven.J.Miller@williams.edu http://www.williams.edu/go/math/sjmiller/

Williams College, September 12, 2008

## **Summary**

- History of the problem.
- Examples.
- Main results and proofs.
- Describe open problems.

# Introduction

#### **Statement**

A finite set of integers, |A| its size. Form

- Sumset:  $A + A = \{a_i + a_i : a_i, a_i \in A\}.$
- Difference set:  $A A = \{a_i a_i : a_i, a_i \in A\}$ .

Programs

Bibliography

# Statement

Introduction

A finite set of integers, |A| its size. Form

- Sumset:  $A + A = \{a_i + a_i : a_i, a_i \in A\}.$
- Difference set:  $A A = \{a_i a_j : a_j, a_j \in A\}$ .

### **Definition**

We say A is difference dominated if |A - A| > |A + A|, balanced if |A - A| = |A + A| and sum dominated (or an MSTD set) if |A + A| > |A - A|.

-

#### **Questions**

Expect generic set to be difference dominated:

- addition is commutative, subtraction isn't:
- Generic pair (x, y) gives 1 sum, 2 differences.

#### **Questions**

Expect generic set to be difference dominated:

- addition is commutative, subtraction isn't:
- Generic pair (x, y) gives 1 sum, 2 differences.

### Questions

- Do there exist sum-dominated sets?
- If yes, how many?

# Examples

# **Examples**

- Conway: {0, 2, 3, 4, 7, 11, 12, 14}.
- Marica (1969): {0, 1, 2, 4, 7, 8, 12, 14, 15}.
- Freiman and Pigarev (1973): {0, 1, 2, 4, 5, 9, 12, 13, 14, 16, 17, 21, 24, 25, 26, 28, 29}.
- Computer search of random subsets of {1,...,100}: {2,6,7,9,13,14,16,18,19,22,23,25,30,31,33,37,39,41,42,45,46,47,48,49,51,52,54,57,58,59,61,64,65,66,67,68,72,73,74,75,81,83,84,87,88,91,93,94,95,98,100}.
- Recently infinite families (Hegarty, Nathanson).

### **Infinite Families**

# **Key observation**

If A is an arithmetic progression, |A + A| = |A - A|.

#### **Infinite Families**

# **Key observation**

If A is an arithmetic progression, |A + A| = |A - A|.

### Proof:

• WLOG,  $A = \{0, 1, ..., n\}$  as  $A \rightarrow \alpha A + \beta$  doesn't change |A + A|, |A - A|.

### **Infinite Families**

# **Key observation**

If A is an arithmetic progression, |A + A| = |A - A|.

### Proof:

- WLOG,  $A = \{0, 1, ..., n\}$  as  $A \rightarrow \alpha A + \beta$  doesn't change |A + A|, |A A|.
- $A + A = \{0, ..., 2n\}, A A = \{-n, ..., n\}$ , both of size 2n + 1.

### **Previous Constructions**

Most constructions perturb an arithmetic progression.

## Example:

- MSTD set  $A = \{0, 2, 3, 4, 7, 11, 12, 14\}.$
- $A = \{0,2\} \cup \{3,7,11\} \cup (14 \{0,2\}) \cup \{4\}.$

## **Example (Nathanson)**

### **Theorem**

 $m, d, k \in \mathbb{N}$  with  $m \ge 4$ ,  $1 \le d \le m-1$ ,  $d \ne m/2$ ,  $k \ge 3$  if d < m/2 else  $k \ge 4$ . Let

- $B = [0, m-1] \setminus \{d\}.$
- $L = \{m d, 2m d, \dots, km d\}.$
- $a^* = (k+1)m 2d$ .
- $A^* = B \cup L \cup (a^* B)$ .
- $A = A^* \cup \{m\}.$

Then A is an MSTD set.

#### **New Construction: Notation**

- $[a, b] = \{k \in \mathbb{Z} : a \le k \le b\}.$
- A is a  $P_n$ -set if its sumset and its difference set contain all but the first and last n possible elements (and of course it may or may not contain some of these fringe elements).

### **New Construction**

Introduction

# Theorem (Miller-Scheinerman '09)

- $A = L \cup R$  be a  $P_n$ , MSTD set where  $L \subset [1, n]$ ,  $R \subset [n + 1, 2n]$ , and  $1, 2n \in A$ .
- Fix a  $k \ge n$  and let m be arbitrary.
- M any subset of [n + k + 1, n + k + m] st no run of more than k missing elements. Assume n + k + 1 ∉ M.
- Set  $A(M) = L \cup O_1 \cup M \cup O_2 \cup R'$ , where  $O_1 = [n+1, n+k]$ ,  $O_2 = [n+k+m+1, n+2k+m]$ , and R' = R + 2k + m.

Then A(M) is an MSTD set, and  $\exists C > 0$  st the percentage of subsets of  $\{0, ..., r\}$  that are in this family (and thus are MSTD sets) is at least  $C/r^4$ .

## Results

# **Probability Review**

X random variable with density f(x) means

- f(x) > 0;
- $\bullet \int_{-\infty}^{\infty} f(x) = 1;$
- Prob $(X \in [a, b]) = \int_a^b f(x) dx$ .

## Key quantities:

- Expected (Average) Value:  $\mathbb{E}[X] = \int x f(x) dx$ .
- Variance:  $\sigma^2 = \int (x \mathbb{E}[X])^2 f(x) dx$ .

### **Binomial model**

# Binomial model, parameter p(n)

Each  $k \in \{0, ..., n\}$  is in A with probability p(n).

Consider uniform model (p(n) = 1/2):

- Let  $A \in \{0, ..., n\}$ . Most elements in  $\{0, ..., 2n\}$  in A + A and in  $\{-n, ..., n\}$  in A A.
- $\mathbb{E}[|A+A|] = 2n-11$ ,  $\mathbb{E}[|A-A|] = 2n-7$ .

## Martin and O'Bryant '06

## **Theorem**

Let A be chosen from  $\{0, \ldots, N\}$  according to the binomial model with constant parameter p (thus  $k \in A$  with probability p). At least  $k_{\text{SD};p}2^{N+1}$  subsets are sum dominated.

## Martin and O'Bryant '06

### **Theorem**

Let A be chosen from  $\{0, ..., N\}$  according to the binomial model with constant parameter p (thus  $k \in A$  with probability p). At least  $k_{\text{SD};p}2^{N+1}$  subsets are sum dominated.

•  $k_{\text{SD};1/2} \ge 10^{-7}$ , expect about  $10^{-3}$ .

Bibliography

## Martin and O'Bryant '06

### **Theorem**

Introduction

Let A be chosen from  $\{0, ..., N\}$  according to the binomial model with constant parameter p (thus  $k \in A$  with probability p). At least  $k_{\text{SD};p}2^{N+1}$  subsets are sum dominated.

- $k_{SD;1/2} \ge 10^{-7}$ , expect about  $10^{-3}$ .
- Proof (p = 1/2): Generically  $|A| = \frac{N}{2} + O(\sqrt{N})$ .
  - $\diamond$  about  $\frac{N}{4} \frac{|N-k|}{4}$  ways write  $k \in A + A$ .
  - $\diamond$  about  $\frac{N}{4} \frac{|k|}{4}$  ways write  $k \in A A$ .
  - $\diamond$  Almost all numbers that can be in  $A \pm A$  are.
  - Win by controlling fringes.

22

### **Notation**

•  $X \sim f(N)$  means  $\forall \epsilon_1, \epsilon_2 > 0$ ,  $\exists N_{\epsilon_1, \epsilon_2}$  st  $\forall N \geq N_{\epsilon_1, \epsilon_2}$ 

Prob 
$$(X \notin [(1 - \epsilon_1)f(N), (1 + \epsilon_1)f(N)]) < \epsilon_2.$$

#### **Notation**

Introduction

• 
$$X \sim f(N)$$
 means  $\forall \epsilon_1, \epsilon_2 > 0$ ,  $\exists N_{\epsilon_1, \epsilon_2}$  st  $\forall N \geq N_{\epsilon_1, \epsilon_2}$   
Prob  $(X \not\in [(1 - \epsilon_1)f(N), (1 + \epsilon_1)f(N)]) < \epsilon_2$ .

• 
$$S = |A + A|$$
,  $D = |A - A|$ ,  
 $S^{c} = 2N + 1 - S$ ,  $D^{c} = 2N + 1 - D$ .

#### **Notation**

Introduction

• 
$$X \sim f(N)$$
 means  $\forall \epsilon_1, \epsilon_2 > 0$ ,  $\exists N_{\epsilon_1, \epsilon_2}$  st  $\forall N \geq N_{\epsilon_1, \epsilon_2}$   
Prob  $(X \not\in [(1 - \epsilon_1)f(N), (1 + \epsilon_1)f(N)]) < \epsilon_2$ .

• 
$$S = |A + A|$$
,  $D = |A - A|$ ,  
 $S^{c} = 2N + 1 - S$ ,  $D^{c} = 2N + 1 - D$ .

New model: Binomial with parameter p(N):

- 1/N = o(p(N)) and p(N) = o(1);
- $\bullet \ \operatorname{Prob}(k \in A) = p(N).$

# **Conjecture (Martin-O'Bryant)**

As  $N \to \infty$ , A is a.s. difference dominated.

#### **Main Result**

Introduction

# Theorem (Hegarty-Miller)

$$p(N)$$
 as above,  $g(x) = 2\frac{e^{-x} - (1-x)}{x}$ .

• 
$$p(N) = o(N^{-1/2})$$
:  $\mathcal{D} \sim 2S \sim (Np(N))^2$ ;

$$\begin{array}{l} \bullet \ \ p(N) = cN^{-1/2} \colon \mathcal{D} \sim g(c^2)N, \, \mathcal{S} \sim g\left(\frac{c^2}{2}\right)N \\ (c \to 0, \, \mathcal{D}/\mathcal{S} \to 2; \, c \to \infty, \, \mathcal{D}/\mathcal{S} \to 1); \end{array}$$

• 
$$N^{-1/2} = o(p(N))$$
:  $S^c \sim 2D^c \sim 4/p(N)^2$ .

Can generalize to binary linear forms, still have critical threshold.

26

Key input: recent strong concentration results of Kim and Vu (Applications: combinatorial number theory, random graphs, ...).

Key input: recent strong concentration results of Kim and Vu (Applications: combinatorial number theory, random graphs, ...).

Example (Chernoff):  $t_i$  iid binary random variables,  $Y = \sum_{i=1}^{n} t_i$ , then

$$\forall \lambda > 0 : \operatorname{Prob}\left(|Y - \mathbb{E}[Y]| \ge \sqrt{\lambda n}\right) \le 2e^{-\lambda/2}.$$

Key input: recent strong concentration results of Kim and Vu (Applications: combinatorial number theory, random graphs, ...).

Example (Chernoff):  $t_i$  iid binary random variables,  $Y = \sum_{i=1}^{n} t_i$ , then

$$\forall \lambda > 0 : \operatorname{Prob}\left(|Y - \mathbb{E}[Y]| \ge \sqrt{\lambda n}\right) \le 2e^{-\lambda/2}.$$

Need to allow dependent random variables.

Introduction

Key input: recent strong concentration results of Kim and Vu (Applications: combinatorial number theory, random graphs, ...).

Example (Chernoff):  $t_i$  iid binary random variables,  $Y = \sum_{i=1}^{n} t_i$ , then

$$\forall \lambda > 0 : \operatorname{Prob}\left(|Y - \mathbb{E}[Y]| \ge \sqrt{\lambda n}\right) \le 2e^{-\lambda/2}.$$

Need to allow dependent random variables. Sketch of proofs:  $\mathcal{X} \in \{\mathcal{S}, \mathcal{D}, \mathcal{S}^c, \mathcal{D}^c\}$ .

- Prove  $\mathbb{E}[\mathcal{X}]$  behaves asymptotically as claimed;
- **2** Prove  $\mathcal{X}$  is strongly concentrated about mean.

## **Proofs**

## Setup

Note: only need strong concentration for  $N^{-1/2} = o(p(N))$ .

### Setup

Note: only need strong concentration for  $N^{-1/2} = o(p(N))$ .

Will assume  $p(N) = o(N^{-1/2})$  as proofs are elementary (i.e., Chebyshev:  $\text{Prob}(|Y - \mathbb{E}[Y]| \ge k\sigma_Y) \le 1/k^2)$ ).

## Setup

Introduction

Note: only need strong concentration for  $N^{-1/2} = o(p(N))$ .

Will assume  $p(N) = o(N^{-1/2})$  as proofs are elementary (i.e., Chebyshev:  $\text{Prob}(|Y - \mathbb{E}[Y]| \ge k\sigma_Y) \le 1/k^2)$ ).

For convenience let  $p(N) = N^{-\delta}$ ,  $\delta \in (1/2, 1)$ .

IID binary indicator variables:

$$X_{n;N} = \begin{cases} 1 & \text{with probability } N^{-\delta} \\ 0 & \text{with probability } 1 - N^{-\delta}. \end{cases}$$

$$X = \sum_{i=1}^{N} X_{n;N}, \mathbb{E}[X] = N^{1-\delta}.$$

#### **Proof**

### Lemma

$$P_1(N) = 4N^{-(1-\delta)},$$
  
 $\mathcal{O} = \#\{(m,n) : m < n \in \{1,\ldots,N\} \cap A\}.$ 

With probability at least  $1 - P_1(N)$  have

35

#### **Proof**

Introduction

### Lemma

$$P_1(N)=4N^{-(1-\delta)},$$

$$\mathcal{O} = \#\{(m, n) : m < n \in \{1, \dots, N\} \cap A\}.$$

With probability at least  $1 - P_1(N)$  have

## Proof:

- (1) is Chebyshev:  $Var(X) = NVar(X_{n:N}) \le N^{1-\delta}$ .
- (2) follows from (1) and  $\binom{r}{2}$  ways to choose 2 from r.

### Concentration

### Lemma

- $f(\delta) = \min(\frac{1}{2}, \frac{3\delta 1}{2})$ ,  $g(\delta)$  any function st  $0 < g(\delta) < f(\delta)$ .
- $p(N) = N^{-\delta}$ ,  $\delta \in (1/2, 1)$ ,  $P_1(N) = 4N^{-(1-\delta)}$ ,  $P_2(N) = CN^{-(f(\delta)-g(\delta))}$ .

With probability at least  $1 - P_1(N) - P_2(N)$  have  $\mathcal{D}/\mathcal{S} = 2 + O(N^{-g(\delta)})$ .

37

### Concentration

Introduction

### Lemma

- $f(\delta) = \min(\frac{1}{2}, \frac{3\delta-1}{2})$ ,  $g(\delta)$  any function st  $0 < g(\delta) < f(\delta)$ .
- $p(N) = N^{-\delta}$ ,  $\delta \in (1/2, 1)$ ,  $P_1(N) = 4N^{-(1-\delta)}$ ,  $P_2(N) = CN^{-(f(\delta)-g(\delta))}$ .

With probability at least  $1 - P_1(N) - P_2(N)$  have  $\mathcal{D}/\mathcal{S} = 2 + O(N^{-g(\delta)})$ .

Proof: Show  $\mathcal{D} \sim 2\mathcal{O} + O(N^{3-4\delta})$ ,  $\mathcal{S} \sim \mathcal{O} + O(N^{3-4\delta})$ .

As  $\mathcal{O}$  is of size  $N^{2-2\delta}$  with high probability, need  $2-2\delta>3-4\delta$  or  $\delta>1/2$ .

Contribution from 'diagonal' terms lower order, ignore.

Contribution from 'diagonal' terms lower order, ignore.

Difficulty: (m, n) and (m', n') could yield same differences.

Contribution from 'diagonal' terms lower order, ignore.

Difficulty: (m, n) and (m', n') could yield same differences.

Notation:  $m < n, m' < n', m \le m'$ ,

$$Y_{m,n,m',n'} = \begin{cases} 1 & \text{if } n-m=n'-m' \\ 0 & \text{otherwise.} \end{cases}$$

Introduction

Contribution from 'diagonal' terms lower order, ignore.

Difficulty: (m, n) and (m', n') could yield same differences.

Notation:  $m < n, m' < n', m \le m'$ ,

$$Y_{m,n,m',n'} = \begin{cases} 1 & \text{if } n-m=n'-m' \\ 0 & \text{otherwise.} \end{cases}$$

$$\mathbb{E}[Y] \le N^3 \cdot N^{-4\delta} + N^2 \cdot N^{-3\delta} \le 2N^{3-4\delta}$$
. As  $\delta > 1/2$ , #{bad pairs}  $\iff \mathcal{O}$ .

42

## Analysis of $\mathcal{D}$

Introduction

Contribution from 'diagonal' terms lower order, ignore.

Difficulty: (m, n) and (m', n') could yield same differences.

Notation:  $m < n, m' < n', m \le m'$ ,

$$Y_{m,n,m',n'} = \begin{cases} 1 & \text{if } n-m=n'-m' \\ 0 & \text{otherwise.} \end{cases}$$

$$\mathbb{E}[Y] \le N^3 \cdot N^{-4\delta} + N^2 \cdot N^{-3\delta} \le 2N^{3-4\delta}$$
. As  $\delta > 1/2$ , #{bad pairs}  $\iff \mathcal{O}$ .

Claim:  $\sigma_Y \leq N^{r(\delta)}$  with  $r(\delta) = \frac{1}{2} \max(3 - 4\delta, 5 - 7\delta)$ . This and Chebyshev conclude proof of theorem.

### **Proof of claim**

Cannot use CLT as  $Y_{m,n,m',n'}$  are not independent.

### **Proof of claim**

Cannot use CLT as  $Y_{m,n,m',n'}$  are not independent.

Use 
$$Var(U + V) \leq 2Var(U) + 2Var(V)$$
.

### **Proof of claim**

Cannot use CLT as  $Y_{m,n,m',n'}$  are not independent.

Use 
$$Var(U + V) \leq 2Var(U) + 2Var(V)$$
.

Write

$$\sum Y_{m,n,m',n'} = \sum U_{m,n,m',n'} + \sum V_{m,n,n'}$$

with all indices distinct (at most one in common, if so must be n = m').

$$\operatorname{Var}(U) = \sum \operatorname{Var}(U_{m,n,m',n'}) + 2 \sum_{\substack{(m,n,m',n') \neq \\ (\widetilde{m},\widetilde{n},\widetilde{m'},\widetilde{n'})}} \operatorname{CoVar}(U_{m,n,m',n'}, U_{\widetilde{m},\widetilde{n},\widetilde{m'},\widetilde{n'}})$$

46

# Analyzing $Var(U_{m,n,m',n'})$

At most  $N^3$  tuples.

Each has variance  $N^{-4\delta} - N^{-8\delta} \le N^{-4\delta}$ .

Thus  $\sum \operatorname{Var}(U_{m,n,m',n'}) \leq N^{3-4\delta}$ .

# Analyzing $CoVar(U_{m,n,m',n'},U_{\widetilde{m},\widetilde{n},\widetilde{m}',\widetilde{n}'})$

- All 8 indices distinct: independent, covariance of 0.
- 7 indices distinct: At most N<sup>3</sup> choices for first tuple, at most N<sup>2</sup> for second, get

$$\mathbb{E}[U_{(1)}U_{(2)}] - \mathbb{E}[U_{(1)}]\mathbb{E}[U_{(2)}] = N^{-7\delta} - N^{-4\delta}N^{-4\delta} \le N^{-7\delta}.$$

• Argue similarly for rest, get  $\ll N^{5-7\delta} + N^{3-4\delta}$ .

# **Open Problems**

## **Probability** *k* in an MSTD set (uniform model)

$$\gamma(k, n) := \text{Prob}(k \in A : A \subset [1, n] \text{ is an MSTD set})$$

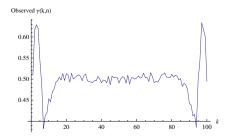

Figure: Observed  $\gamma(k, 100)$ , random sample 4458 MSTD sets.

### Conjecture

Fix a constant  $0 < \alpha < 1$ . Then  $\lim_{n \to \infty} \gamma(k, n) = 1/2$  for  $|\alpha n| < k < n - |\alpha n|$ .

Introduction

### Generalization of main result

Introduction

Theorem (Hegarty-M): Binomial model with parameter p(N) as before, u, v be non-zero integers with  $u \ge |v|$ , gcd(u, v) = 1 and  $(u, v) \ne (1, 1)$ . Put f(x, y) := ux + vy and let  $\mathcal{D}_f$  denote the random variable |f(A)|. Then the following three situations arise:

$$\mathcal{D}_f \sim (N \cdot p(N))^2$$
.

 $p(N) = c \cdot N^{-1/2}$  for some  $c \in (0, \infty)$ : Define the function  $g_{u,v}: (0, \infty) \to (0, u + |v|)$  by

$$g_{u,v}(x) := (u+|v|)-2|v|\left(\frac{1-e^{-x}}{x}\right)-(u-|v|)e^{-x}.$$

Then

$$\mathcal{D}_f \sim g_{u,v}\left(\frac{c^2}{u}\right) N.$$

**3**  $N^{-1/2} = o(p(N))$ : Let  $\mathcal{D}_f^c := (u + |v|)N - \mathcal{D}_f$ . Then  $\mathcal{D}_f^c \sim \frac{2u|v|}{p(N)^2}$ .

## Generalization of main results (cont)

Let f, g be two binary linear forms. Say f dominates g for the parameter p(N) if, as  $N \to \infty$ , |f(A)| > |g(A)| almost surely when A is a random subset (binomial model with parameter p(N)).

Theorem (Hegarty-M):  $f(x, y) = u_1x + u_2y$  and  $g(x, y) = u_2x + g_2y$ , where  $u_i \ge |v_i| > 0$ ,  $gcd(u_i, v_i) = 1$  and  $(u_2, v_2) \ne (u_1, \pm v_1)$ . Let

$$\alpha(u,v) := \frac{1}{u^2} \left( \frac{|v|}{3} + \frac{u - |v|}{2} \right) = \frac{3u - |v|}{6u^2}.$$

The following two situations can be distinguished:

- $u_1 + |v_1| \ge u_2 + |v_2|$  and  $\alpha(u_1, v_1) < \alpha(u_2, v_2)$ . Then f dominates g for all p such that  $N^{-3/5} = o(p(N))$  and p(N) = o(1). In particular, every other difference form dominates the form x y in this range.
- $u_1 + |v_1| > u_2 + |v_2|$  and  $\alpha(u_1, v_1) > \alpha(u_2, v_2)$ . Then there exists  $c_{f,g} > 0$  such that one form dominates for  $p(N) < cN^{-1/2}$   $(c < c_{f,g})$  and other dominates for  $p(N) > cN^{-1/2}$   $(c > c_{f,g})$ .

Introduction

## **Open Problems**

- One unresolved matter is the comparison of arbitrary difference forms in the range where N<sup>-3/4</sup> = O(p) and p = O(N<sup>-3/5</sup>).
   Note that the property of one binary form dominating another is not monotone, or even convex.
- A very tantalizing problem is to investigate what happens while crossing a sharp threshold.
- One can ask if the various concentration estimates can be improved (i.e., made explicit).

# **Programs**

## Mathematica Code: Computing Sum/Difference Set
