Pythagoras at the Bat:
An Introduction to Stats and Modeling

Cameron, Kayla and Steven Miller
(sjm1@williams.edu, Williams College)

http://web.williams.edu/Mathematics/sjmiller/public_html/
Acknowledgments

Sal Baxamusa, Phil Birnbaum, Chris Chiang, Ray Ciccolella, Steve Johnston, Michelle Manes, Russ Mann, students of Math 162 and Math 197 at Brown, Math 150 and 399 at Williams.

Dedicated to my great uncle Newt Bromberg (a lifetime Red Sox fan who promised me that I would live to see a World Series Championship in Boston).

Chris Long and the San Diego Padres.
Acknowledgments
Thoughts on Research
Research: What questions to ask? How? With whom?

- Build on what you know and can learn.
- What will be interesting?
- How will you work?
- Where are the questions? Classes, arXiv, conferences, ....
Explore: Look for the right perspective.

- Ask interesting questions.
- Look for connections.
- Be a bit of a jack-of-all trades.

Leads naturally into....
Utilize: What are your tools and how can they be used?

Law of the Hammer:

- Abraham Kaplan: I call it the law of the instrument, and it may be formulated as follows: Give a small boy a hammer, and he will find that everything he encounters needs pounding.

- Abraham Maslow: I suppose it is tempting, if the only tool you have is a hammer, to treat everything as if it were a nail.

- Bernard Baruch: If all you have is a hammer, everything looks like a nail.
Succeed: Control what you can: reports, talks

- Write up your work: post on the arXiv, submit.
- Go to conferences: present and mingle (no spam and P&J).
- Turn things around fast: show progress, no more than 24 hours on mundane.
- Service: refereeing, MathSciNet, ....
Introduction to the Pythagorean Won–Loss Theorem
Goals of the Talk

- Give derivation Pythagorean Won–Loss formula.
- Observe ideas / techniques of modeling.
- See how advanced theory enters in simple problems.
- Opportunities from inefficiencies.
- Xtra: further avenues for research for students.
Goals of the Talk

- **Give** derivation Pythagorean Won–Loss formula.

- **Observe** ideas / techniques of modeling.

- **See** how advanced theory enters in simple problems.

- **Opportunities** from inefficiencies.

- **Xtra**: further avenues for research for students.

Numerical Observation: Pythagorean Won–Loss Formula

Parameters

- $RS_{\text{obs}}$: average number of runs scored per game;
- $RA_{\text{obs}}$: average number of runs allowed per game;
- $\gamma$: some parameter, constant for a sport.
Numerical Observation: Pythagorean Won–Loss Formula

Parameters

- $RS_{\text{obs}}$: average number of runs scored per game;
- $RA_{\text{obs}}$: average number of runs allowed per game;
- $\gamma$: some parameter, constant for a sport.

James’ Won–Loss Formula (NUMERICAL Observation)

$$\text{Won} - \text{Loss Percentage} = \frac{\#\text{Wins}}{\#\text{Games}} = \frac{RS_{\text{obs}}^\gamma}{RS_{\text{obs}}^\gamma + RA_{\text{obs}}^\gamma}$$

$\gamma$ originally taken as 2, numerical studies show best $\gamma$ for baseball is about 1.82.
Pythagorean Won–Loss Formula: Example

James’ Won–Loss Formula

\[
\text{Won – Loss Percentage} = \frac{\text{#Wins}}{\text{#Games}} = \frac{\text{RS}_\text{obs}^\gamma}{\text{RS}_\text{obs}^\gamma + \text{RA}_\text{obs}^\gamma}
\]

Example ($\gamma = 1.82$): In 2009 the Red Sox were 95–67. They scored 872 runs and allowed 736, for a Pythagorean prediction record of 93.4 wins and 68.6 losses; the Yankees were 103–59 but predicted to be 95.2–66.8 (they scored 915 runs and allowed 753).
Pythagorean Won–Loss Formula: Example

James’ Won–Loss Formula

\[
\text{Won \text{–} Loss Percentage} = \frac{\#\text{Wins}}{\#\text{Games}} = \frac{\text{RS}^\gamma_{\text{obs}}}{\text{RS}^\gamma_{\text{obs}} + \text{RA}^\gamma_{\text{obs}}}
\]

Example \((\gamma = 1.82)\): In 2009 the Red Sox were 95–67. They scored 872 runs and allowed 736, for a Pythagorean prediction record of 93.4 wins and 68.6 losses; the Yankees were 103–59 but predicted to be 95.2–66.8 (they scored 915 runs and allowed 753).

2011: Red Sox ‘should’ be 95-67, Tampa ‘should’ be 92-70....
Applications of the Pythagorean Won–Loss Formula

- **Extrapolation**: use half-way through season to predict a team’s performance for rest of season.

- **Evaluation**: see if consistently over-perform or under-perform.

- **Advantage**: Other statistics / formulas (run-differential per game); this is easy to use, depends only on two simple numbers for a team.
Applications of the Pythagorean Won–Loss Formula

- **Extrapolation**: use half-way through season to predict a team’s performance for rest of season.

- **Evaluation**: see if consistently over-perform or under-perform.

- **Advantage**: Other statistics / formulas (run-differential per game); this is easy to use, depends only on two simple numbers for a team.

Probability and Modeling
Observed scoring distributions

Goal is to model observed scoring distributions; for example, consider
Let $X$ be random variable with density $p(x)$:

- $p(x) \geq 0$;
- $\int_{-\infty}^{\infty} p(x)\,dx = 1$;
- $\text{Prob}(a \leq X \leq b) = \int_{a}^{b} p(x)\,dx$. 
Let $X$ be random variable with density $p(x)$:
- $p(x) \geq 0$;
- $\int_{-\infty}^{\infty} p(x) dx = 1$;
- $\text{Prob}(a \leq X \leq b) = \int_{a}^{b} p(x) dx$.

Mean $\mu = \int_{-\infty}^{\infty} xp(x) dx$. 

Let $X$ be random variable with density $p(x)$:

- $p(x) \geq 0$;
- $\int_{-\infty}^{\infty} p(x) \, dx = 1$;
- $\text{Prob}(a \leq X \leq b) = \int_{a}^{b} p(x) \, dx$.

**Mean** $\mu = \int_{-\infty}^{\infty} x \, p(x) \, dx$.

**Variance** $\sigma^2 = \int_{-\infty}^{\infty} (x - \mu)^2 \, p(x) \, dx$. 
Probability Review

- Let $X$ be a random variable with density $p(x)$:
  - $p(x) \geq 0$;
  - $\int_{-\infty}^{\infty} p(x) \, dx = 1$;
  - $\text{Prob}(a \leq X \leq b) = \int_{a}^{b} p(x) \, dx$.

- Mean $\mu = \int_{-\infty}^{\infty} xp(x) \, dx$.

- Variance $\sigma^2 = \int_{-\infty}^{\infty} (x - \mu)^2 p(x) \, dx$.

- Independence: knowledge of one random variable gives no knowledge of the other.
Guidelines for Modeling:

- Model should capture key features of the system;
- Model should be mathematically tractable (solvable).
Modeling the Real World (cont)

Possible Model:

- Runs Scored and Runs Allowed independent random variables;
- $f_{RS}(x)$, $g_{RA}(y)$: probability density functions for runs scored (allowed).
Possible Model:

- Runs Scored and Runs Allowed independent random variables;
- \( f_{RS}(x), g_{RA}(y) \): probability density functions for runs scored (allowed).

Won–Loss formula follows from computing

\[
\int_{x=0}^{\infty} \left[ \int_{y \leq x} f_{RS}(x)g_{RA}(y) \, dy \right] \, dx \quad \text{or} \quad \sum_{i=0}^{\infty} \left[ \sum_{j<i} f_{RS}(i)g_{RA}(j) \right].
\]
Problems with the Model

Reduced to calculating

\[
\int_{x=0}^{\infty} \left[ \int_{y \leq x} f_{RS}(x) g_{RA}(y) \, dy \right] \, dx \quad \text{or} \quad \sum_{i=0}^{\infty} \left[ \sum_{j<i} f_{RS}(i) g_{RA}(j) \right].
\]
Problems with the Model

Reduced to calculating

\[ \int_{x=0}^{\infty} \left[ \int_{y \leq x}^{\infty} f_{RS}(x)g_{RA}(y)dy \right] dx \quad \text{or} \quad \sum_{i=0}^{\infty} \left[ \sum_{j<i} f_{RS}(i)g_{RA}(j) \right]. \]

Problems with the model:

- What are explicit formulas for \( f_{RS} \) and \( g_{RA} \)?
- Are the runs scored and allowed independent random variables?
- Can the integral (or sum) be computed in closed form?
Choices for $f_{RS}$ and $g_{RA}$

Uniform Distribution on $[0, 10]$. 
Choices for $f_{RS}$ and $g_{RA}$

Normal Distribution: mean 4, standard deviation 2.
Choices for $f_{RS}$ and $g_{RA}$

Exponential Distribution: $e^{-x}$. 

![Exponential Distribution Graph](image-url)
Three Parameter Weibull

Weibull distribution:

\[ f(x; \alpha, \beta, \gamma) = \begin{cases} \frac{\gamma}{\alpha} \left( \frac{x-\beta}{\alpha} \right)^{\gamma-1} e^{-\left(\frac{x-\beta}{\alpha}\right)^\gamma} & \text{if } x \geq \beta \\ 0 & \text{otherwise.} \end{cases} \]

\begin{itemize}
  \item \(\alpha\): scale (variance: meters versus centimeters);
  \item \(\beta\): origin (mean: translation, zero point);
  \item \(\gamma\): shape (behavior near \(\beta\) and at infinity).
\end{itemize}

Various values give different shapes, but can we find \(\alpha, \beta, \gamma\) such that it fits observed data? Is the Weibull justifiable by some reasonable hypotheses?
Weibull Plots: Parameters \((\alpha, \beta, \gamma)\):

\[
f(x; \alpha, \beta, \gamma) = \begin{cases} 
\frac{\gamma}{\alpha} \left( \frac{x-\beta}{\alpha} \right)^{\gamma-1} e^{-((x-\beta)/\alpha)^\gamma} & \text{if } x \geq \beta \\
0 & \text{otherwise.}
\end{cases}
\]

Red: \((1, 0, 1)\) (exponential); Green: \((1, 0, 2)\); Cyan: \((1, 2, 2)\); Blue: \((1, 2, 4)\)
Three Parameter Weibull: Applications

\[ f(x; \alpha, \beta, \gamma) = \begin{cases} \frac{\gamma}{\alpha} \left(\frac{x-\beta}{\alpha}\right)^{\gamma-1} e^{-((x-\beta)/\alpha)^\gamma} & \text{if } x \geq \beta \\ 0 & \text{otherwise.} \end{cases} \]

Arises in many places, such as survival analysis.

- \( \gamma < 1 \): high infant mortality;
- \( \gamma = 1 \): constant failure rate;
- \( \gamma > 1 \): aging process.
The Gamma Distribution and Weibulls

- For $s > 0$, define the $\Gamma$-function by

$$\Gamma(s) = \int_0^\infty e^{-u}u^{s-1}du = \int_0^\infty e^{-u}u^s\frac{du}{u}.$$ 

- Generalizes factorial function: $\Gamma(n) = (n - 1)!$ for $n \geq 1$ an integer.

A Weibull distribution with parameters $\alpha, \beta, \gamma$ has:

- Mean: $\alpha \Gamma(1 + 1/\gamma) + \beta$.
- Variance: $\alpha^2 \Gamma(1 + 2/\gamma) - \alpha^2 \Gamma(1 + 1/\gamma)^2$. 

Weibull Integrations

\[
\mu_{\alpha, \beta, \gamma} = \int_{\beta}^{\infty} x \cdot \frac{\gamma}{\alpha} \left(\frac{x - \beta}{\alpha}\right)^{\gamma-1} e^{-\left(\frac{x - \beta}{\alpha}\right)^{\gamma}} \, dx
\]

\[
= \int_{\beta}^{\infty} \frac{x - \beta}{\alpha} \cdot \frac{\gamma}{\alpha} \left(\frac{x - \beta}{\alpha}\right)^{\gamma-1} e^{-\left(\frac{x - \beta}{\alpha}\right)^{\gamma}} \, dx + \beta.
\]

Change variables: \( u = \left(\frac{x - \beta}{\alpha}\right)^{\gamma} \), so \( du = \frac{\gamma}{\alpha} \left(\frac{x - \beta}{\alpha}\right)^{\gamma-1} \, dx \) and

\[
\mu_{\alpha, \beta, \gamma} = \int_{0}^{\infty} \alpha u^{1/\gamma} \cdot e^{-u} \, du + \beta
\]

\[
= \alpha \int_{0}^{\infty} e^{-u} u^{1+1/\gamma} \frac{du}{u} + \beta
\]

\[
= \alpha \Gamma\left(1 + 1/\gamma\right) + \beta.
\]

A similar calculation determines the variance.
The Pythagorean Theorem

Building Intuition: The log $-5$ Method

Assume team $A$ wins $p$ percent of their games, and team $B$ wins $q$ percent of their games. Which formula do you think does a good job of predicting the probability that team $A$ beats team $B$? Why?

\[
\frac{p + pq}{p + q + 2pq}, \quad \frac{p + pq}{p + q - 2pq}, \quad \frac{p - pq}{p + q + 2pq}, \quad \frac{p - pq}{p + q - 2pq}
\]
Estimating Winning Percentages

\[
\frac{p + pq}{p + q + 2pq}, \quad \frac{p + pq}{p + q - 2pq}, \quad \frac{p - pq}{p + q + 2pq}, \quad \frac{p - pq}{p + q - 2pq}
\]

How can we test these candidates?

Can you think of answers for special choices of \( p \) and \( q \)?
Estimating Winning Percentages

\[
\frac{p + pq}{p + q + 2pq}, \quad \frac{p + pq}{p + q - 2pq}, \quad \frac{p - pq}{p + q + 2pq}, \quad \frac{p - pq}{p + q - 2pq}
\]

Homework: explore the following:

◊ \( p = 1, \ q < 1 \) (do not want the battle of the undefeated).

◊ \( p = 0, \ q > 0 \) (do not want the Toilet Bowl).

◊ \( p = q \).

◊ \( p > q \) (can do \( q < 1/2 \) and \( q > 1/2 \)).

◊ Anything else where you ‘know’ the answer?
Estimating Winning Percentages

\[
\frac{p + pq}{p + q + 2pq}, \quad \frac{p + pq}{p + q - 2pq}, \quad \frac{p - pq}{p + q + 2pq}, \quad \frac{p - pq}{p + q - 2pq}
\]
Estimating Winning Percentages

\[
\frac{p - pq}{p + q - 2pq} = \frac{p(1 - q)}{p(1 - q) + (1 - p)q}
\]

Homework: explore the following:

◊ \( p = 1, \ q < 1 \) (do not want the battle of the undefeated).

◊ \( p = 0, \ q > 0 \) (do not want the Toilet Bowl).

◊ \( p = q \).

◊ \( p > q \) (can do \( q < 1/2 \) and \( q > 1/2 \)).

◊ Anything else where you ‘know’ the answer?
Estimating Winning Percentages: ‘Proof’

Start

A has a good game with probability $p$

B has a good game with probability $q$
Estimating Winning Percentages: ‘Proof’

**Figure:** Two possibilities: A has a good day, or A doesn’t.
Estimating Winning Percentages: ‘Proof’

Figure: $B$ has a good day, or doesn’t.
Estimating Winning Percentages: ‘Proof’

Figure: Two paths terminate, two start again.
Estimating Winning Percentages: ‘Proof’

Probability A wins is \[ \frac{p(1-q)}{p(1-q) + (1-p)q} = \frac{p - pq}{p + q - 2pq} \]
Theorem: Pythagorean Won–Loss Formula (Miller ’06)

Let the runs scored and allowed per game be two independent random variables drawn from Weibull distributions $(\alpha_{RS}, \beta, \gamma)$ and $(\alpha_{RA}, \beta, \gamma)$; $\alpha_{RS}$ and $\alpha_{RA}$ are chosen so that the Weibull means are the observed sample values RS and RA. If $\gamma > 0$ then the Won–Loss Percentage is

$$\frac{RS^\gamma_{obs}}{RS^\gamma_{obs} + RA^\gamma_{obs}}.$$
Pythagorean Won–Loss Formula: \( \frac{RS^\gamma_{\text{obs}}}{RS^\gamma_{\text{obs}} + RA^\gamma_{\text{obs}}} \)

**Theorem: Pythagorean Won–Loss Formula (Miller ’06)**

Let the runs scored and allowed per game be two independent random variables drawn from Weibull distributions \((\alpha_{RS}, \beta, \gamma)\) and \((\alpha_{RA}, \beta, \gamma)\); \(\alpha_{RS}\) and \(\alpha_{RA}\) are chosen so that the Weibull means are the observed sample values \(RS\) and \(RA\). If \(\gamma > 0\) then the Won–Loss Percentage is \(\frac{(RS - \beta)^{\gamma}}{(RS - \beta)^{\gamma} + (RA - \beta)^{\gamma}}\).

Take \(\beta = -1/2\) (since runs must be integers). \(RS - \beta\) estimates average runs scored, \(RA - \beta\) estimates average runs allowed.

Weibull with parameters \((\alpha, \beta, \gamma)\) has mean \(\alpha \Gamma (1 + 1/\gamma) + \beta\).
Proof of the Pythagorean Won–Loss Formula

Let $X$ and $Y$ be independent random variables with Weibull distributions $(\alpha_{RS}, \beta, \gamma)$ and $(\alpha_{RA}, \beta, \gamma)$ respectively. To have means of $RS - \beta$ and $RA - \beta$ our calculations for the means imply

$$\alpha_{RS} = \frac{RS - \beta}{\Gamma(1 + 1/\gamma)}, \quad \alpha_{RA} = \frac{RA - \beta}{\Gamma(1 + 1/\gamma)}.$$

We need only calculate the probability that $X$ exceeds $Y$. We use the integral of a probability density is 1.
Proof of the Pythagoreian Won–Loss Formula (cont)

\[ \text{Prob}(X > Y) = \int_\beta^\infty \int_y^\infty f(x; \alpha_{RS}, \beta, \gamma) f(y; \alpha_{RA}, \beta, \gamma) \, dy \, dx \]

\[ = \int_\beta^\infty \int_y^\infty \frac{\gamma}{\alpha_{RS}} \left( \frac{x - \beta}{\alpha_{RS}} \right)^{\gamma - 1} e^{-\left(\frac{x - \beta}{\alpha_{RS}}\right)^\gamma} \frac{\gamma}{\alpha_{RA}} \left( \frac{y - \beta}{\alpha_{RA}} \right)^{\gamma - 1} e^{-\left(\frac{y - \beta}{\alpha_{RA}}\right)^\gamma} \, dy \, dx \]

\[ = \int_0^\infty \frac{\gamma}{\alpha_{RS}} \left( \frac{x}{\alpha_{RS}} \right)^{\gamma - 1} e^{-\left(\frac{x}{\alpha_{RS}}\right)^\gamma} \left[ \int_0^x \frac{\gamma}{\alpha_{RA}} \left( \frac{y}{\alpha_{RA}} \right)^{\gamma - 1} e^{-\left(\frac{y}{\alpha_{RA}}\right)^\gamma} \, dy \right] \, dx \]

\[ = \int_0^\infty \frac{\gamma}{\alpha_{RS}} \left( \frac{x}{\alpha_{RS}} \right)^{\gamma - 1} e^{-\left(\frac{x}{\alpha_{RS}}\right)^\gamma} \left[ 1 - e^{-\left(\frac{x}{\alpha_{RA}}\right)^\gamma} \right] \, dx \]

\[ = 1 - \int_0^\infty \frac{\gamma}{\alpha_{RS}} \left( \frac{x}{\alpha_{RS}} \right)^{\gamma - 1} e^{-\left(\frac{x}{\alpha}\right)^\gamma} \, dx, \]

where we have set

\[ \frac{1}{\alpha^\gamma} = \frac{1}{\alpha_{RS}^\gamma} + \frac{1}{\alpha_{RA}^\gamma} = \frac{\alpha_{RS}^\gamma + \alpha_{RA}^\gamma}{\alpha_{RS}^\gamma \alpha_{RA}^\gamma}. \]
Proof of the Pythagorean Won–Loss Formula (cont)

\[
\text{Prob}(X > Y) = 1 - \frac{\alpha^\gamma}{\alpha_{RS}^{\gamma}} \int_0^\infty \frac{\gamma}{\alpha} \left( \frac{X}{\alpha} \right)^{\gamma - 1} e^{(x/\alpha)^\gamma} \, dx
\]

\[
= 1 - \frac{\alpha^\gamma}{\alpha_{RS}^{\gamma}}
\]

\[
= 1 - \frac{\alpha_{RS}^\gamma \alpha_{RA}^\gamma}{\alpha_{RS}^\gamma + \alpha_{RA}^\gamma}
\]

\[
= \frac{\alpha_{RS}^\gamma}{\alpha_{RS}^\gamma + \alpha_{RA}^\gamma}.
\]
Proof of the Pythagorean Won–Loss Formula (cont)

\[
\text{Prob}(X > Y) = 1 - \frac{\alpha_R^\gamma}{\alpha_{RS}^\gamma} \int_0^\infty \frac{\gamma}{\alpha} \left( \frac{X}{\alpha} \right)^{\gamma-1} e^{(x/\alpha)^\gamma} \, dx
\]

\[
= 1 - \frac{\alpha_R^\gamma}{\alpha_{RS}^\gamma}
\]

\[
= 1 - \frac{1}{\alpha_{RS}^\gamma + \alpha_{RA}^\gamma}
\]

\[
= \frac{\alpha_{RS}^\gamma}{\alpha_{RS}^\gamma + \alpha_{RA}^\gamma}.
\]

We substitute the relations for \(\alpha_{RS}\) and \(\alpha_{RA}\) and find that

\[
\text{Prob}(X > Y) = \frac{(RS - \beta)^\gamma}{(RS - \beta)^\gamma + (RA - \beta)^\gamma}.
\]

Note \(RS - \beta\) estimates \(RS_{\text{obs}}\), \(RA - \beta\) estimates \(RA_{\text{obs}}\).

$\gamma$: mean = 1.74, standard deviation = .06, median = 1.76; close to numerically observed value of 1.82.
Conclusions

- Find parameters such that Weibulls are good fits;

- Runs scored and allowed per game are statistically independent;

- Pythagorean Won–Loss Formula is a consequence of our model;

- Best $\gamma$ (both close to observed best 1.82):
  - Method of Least Squares: 1.79;
  - Method of Maximum Likelihood: 1.74.
Future Work

- **Micro-analysis:** runs scored and allowed aren’t independent (big lead, close game), run production smaller for inter-league games in NL parks, ....

- **Other sports:** Does the same model work? Basketball has $\gamma$ between 14 and 16.5.

- **Closed forms:** Are there other probability distributions that give integrals which can be determined in closed form?

- **Valuing Runs:** Pythagorean formula used to value players (10 runs equals 1 win); better model leads to better team.

Appendices
Appendix I: Proof of the Pythagorean Won–Loss Formula

Let $X$ and $Y$ be independent random variables with Weibull distributions $(\alpha_{RS}, \beta, \gamma)$ and $(\alpha_{RA}, \beta, \gamma)$ respectively. To have means of $RS − \beta$ and $RA − \beta$ our calculations for the means imply

$$\alpha_{RS} = \frac{RS − \beta}{\Gamma(1 + 1/\gamma)}, \quad \alpha_{RA} = \frac{RA − \beta}{\Gamma(1 + 1/\gamma)}.$$  

We need only calculate the probability that $X$ exceeds $Y$. We use the integral of a probability density is 1.
Appendix I: Proof of the Pythagorean Won–Loss Formula (cont)

\[
\text{Prob}(X > Y) = \int_{x=\beta}^{\infty} \int_{y=\beta}^{x} f(x; \alpha_{RS}, \beta, \gamma) f(y; \alpha_{RA}, \beta, \gamma) \, dy \, dx
\]

\[
= \int_{\beta}^{\infty} \int_{\beta}^{x} \frac{\gamma}{\alpha_{RS}} \left( \frac{x - \beta}{\alpha_{RS}} \right)^{\gamma-1} e^{-\left( \frac{x-\beta}{\alpha_{RS}} \gamma \right)} \frac{\gamma}{\alpha_{RA}} \left( \frac{y - \beta}{\alpha_{RA}} \right)^{\gamma-1} e^{-\left( \frac{y-\beta}{\alpha_{RA}} \gamma \right)} \, dy \, dx
\]

\[
= \int_{x=0}^{\infty} \frac{\gamma}{\alpha_{RS}} \left( \frac{x}{\alpha_{RS}} \right)^{\gamma-1} e^{-\left( \frac{x}{\alpha_{RS}} \gamma \right)} \left[ \int_{y=0}^{x} \frac{\gamma}{\alpha_{RA}} \left( \frac{y}{\alpha_{RA}} \right)^{\gamma-1} e^{-\left( \frac{y}{\alpha_{RA}} \gamma \right)} \, dy \right] \, dx
\]

\[
= \int_{x=0}^{\infty} \frac{\gamma}{\alpha_{RS}} \left( \frac{x}{\alpha_{RS}} \right)^{\gamma-1} e^{-\left( \frac{x}{\alpha_{RS}} \gamma \right)} \left[ 1 - e^{-\left( \frac{x}{\alpha_{RA}} \gamma \right)} \right] \, dx
\]

\[
= 1 - \int_{x=0}^{\infty} \frac{\gamma}{\alpha_{RS}} \left( \frac{x}{\alpha_{RS}} \right)^{\gamma-1} e^{-\left( \frac{x}{\alpha} \gamma \right)} \, dx,
\]

where we have set

\[
\frac{1}{\alpha \gamma} = \frac{1}{\alpha_{RS} \gamma} + \frac{1}{\alpha_{RA} \gamma} = \frac{\alpha_{RS} \gamma + \alpha_{RA} \gamma}{\alpha_{RS} \alpha_{RA} \gamma}.
\]
Appendix I: Proof of the Pythagorean Won–Loss Formula (cont)

\[
\text{Prob}(X > Y) = 1 - \frac{\alpha^\gamma}{\alpha_{RS}^\gamma} \int_0^\infty \frac{\gamma}{\alpha} \left( \frac{X}{\alpha} \right)^{\gamma-1} e^{(x/\alpha)^\gamma} \, dx
\]

\[
= 1 - \frac{\alpha^\gamma}{\alpha_{RS}^\gamma}
\]

\[
= 1 - \frac{1}{\alpha_{RS}^\gamma} \frac{\alpha_{RS}^\gamma \alpha_{RA}^\gamma}{\alpha_{RS}^\gamma + \alpha_{RA}^\gamma}
\]

\[
= \frac{\alpha_{RS}^\gamma}{\alpha_{RS}^\gamma + \alpha_{RA}^\gamma}.
\]

We substitute the relations for \( \alpha_{RS} \) and \( \alpha_{RA} \) and find that

\[
\text{Prob}(X > Y) = \frac{(RS - \beta)^\gamma}{(RS - \beta)^\gamma + (RA - \beta)^\gamma}.
\]

Note \( RS - \beta \) estimates \( RS_{obs} \), \( RA - \beta \) estimates \( RA_{obs} \).
Appendix II: Best Fit Weibulls and Structural Zeros

The fits *look* good, but are they? Do $\chi^2$-tests:

- Let $\text{Bin}(k)$ denote the $k^{\text{th}}$ bin.
- $O_{r,c}$: the observed number of games where the team’s runs scored is in $\text{Bin}(r)$ and the runs allowed are in $\text{Bin}(c)$.
- $E_{r,c} = \frac{\sum_{c'} O_{r,c'} \cdot \sum_{r'} O_{r',c}}{\#\text{Games}}$ is the expected frequency of cell $(r, c)$.
- Then

$$\sum_{r=1}^{\#\text{Rows}} \sum_{c=1}^{\#\text{Columns}} \frac{(O_{r,c} - E_{r,c})^2}{E_{r,c}}$$

is a $\chi^2$ distribution with $(\#\text{Rows} - 1)(\#\text{Columns} - 1)$ degrees of freedom.
Appendix II: Best Fit Weibulls and Structural Zeros (cont)

For independence of runs scored and allowed, use bins

\[ 0, 1) \cup [1, 2) \cup [2, 3) \cup \cdots \cup [8, 9) \cup [9, 10) \cup [10, 11) \cup [11, \infty). \]

Have an \( r \times c \) contingency table (with \( r = c = 12 \)); however, there are structural zeros (runs scored and allowed per game can never be equal).

(Essentially) \( O_{r,r} = 0 \) for all \( r \). We use the iterative fitting procedure to obtain maximum likelihood estimators for the \( E_{r,c} \), the expected frequency of cell \((r, c)\) under the assumption that, given that the runs scored and allowed are distinct, the runs scored and allowed are independent.

For \( 1 \leq r, c \leq 12 \), let \( E^{(0)}_{r,c} = 1 \) if \( r \neq c \) and 0 if \( r = c \). Set

\[
X_{r,+} = \sum_{c=1}^{12} O_{r,c}, \quad X_{+,c} = \sum_{r=1}^{12} O_{r,c}.
\]

Then

\[
E^{(\ell)}_{r,c} = \begin{cases} 
E^{(\ell-1)}_{r,c} X_{r,+} / \sum_{c=1}^{12} E^{(\ell-1)}_{r,c} & \text{if } \ell \text{ is odd} \\
E^{(\ell-1)}_{r,c} X_{+,c} / \sum_{r=1}^{12} E^{(\ell-1)}_{r,c} & \text{if } \ell \text{ is even,}
\end{cases}
\]

and

\[
E_{r,c} = \lim_{\ell \to \infty} E^{(\ell)}_{r,c};
\]

the iterations converge very quickly. (If we had a complete two-dimensional contingency table, then the iteration reduces to the standard values, namely \( E_{r,c} = \sum_{c'=1}^{c} O_{r,c'} \cdot \sum_{r'=1}^{r} O_{r',c} / \#\text{Games} \).) Note

\[
\sum_{r=1}^{12} \sum_{c=1}^{12} \left( \frac{O_{r,c} - E_{r,c}}{E_{r,c}} \right)^2
\]
Appendix III: Central Limit Theorem

Convolution of $f$ and $g$:

$$h(y) = (f * g)(y) = \int_{\mathbb{R}} f(x)g(y - x)dx = \int_{\mathbb{R}} f(x - y)g(x)dx.$$ 

$X_1$ and $X_2$ independent random variables with probability density $p$.

$$\text{Prob}(X_i \in [x, x + \Delta x]) = \int_{x}^{x+\Delta x} p(t)dt \approx p(x)\Delta x.$$ 

$$\text{Prob}(X_1 + X_2 \in [x, x + \Delta x]) = \int_{x_1=-\infty}^{x_2=\infty} \int_{x_2=x-x_1}^{x_2+x_1} p(x_1)p(x_2)dx_2dx_1.$$ 

As $\Delta x \to 0$ we obtain the convolution of $p$ with itself:

$$\text{Prob}(X_1 + X_2 \in [a, b]) = \int_{a}^{b} (p * p)(z)dz.$$ 

Exercise to show non-negative and integrates to 1.
Appendix III: Statement of Central Limit Theorem

For simplicity, assume $p$ has mean zero, variance one, finite third moment and is of sufficiently rapid decay so that all convolution integrals that arise converge: $p$ an infinitely differentiable function satisfying

$$
\int_{-\infty}^{\infty} xp(x)dx = 0, \quad \int_{-\infty}^{\infty} x^2 p(x)dx = 1, \quad \int_{-\infty}^{\infty} |x|^3 p(x)dx < \infty.
$$

Assume $X_1, X_2, \ldots$ are independent identically distributed random variables drawn from $p$. Define $S_N = \sum_{i=1}^{N} X_i$.

Standard Gaussian (mean zero, variance one) is $\frac{1}{\sqrt{2\pi}} e^{-x^2/2}$.

**Central Limit Theorem** Let $X_i, S_N$ be as above and assume the third moment of each $X_i$ is finite. Then $S_N / \sqrt{N}$ converges in probability to the standard Gaussian:

$$
\lim_{N \to \infty} \text{Prob} \left( \frac{S_N}{\sqrt{N}} \in [a, b] \right) = \frac{1}{\sqrt{2\pi}} \int_{a}^{b} e^{-x^2/2}dx.
$$
Appendix III: Proof of the Central Limit Theorem

The Fourier transform of $p$ is

\[ \hat{p}(y) = \int_{-\infty}^{\infty} p(x) e^{-2\pi ixy} \, dx. \]

Derivative of $\hat{g}$ is the Fourier transform of $2\pi ixg(x)$; differentiation (hard) is converted to multiplication (easy).

\[ \hat{g}'(y) = \int_{-\infty}^{\infty} 2\pi ix \cdot g(x) e^{-2\pi ixy} \, dx. \]

If $g$ is a probability density, $\hat{g}'(0) = 2\pi i\mathbb{E}[x]$ and $\hat{g}''(0) = -4\pi^2 \mathbb{E}[x^2]$.

Natural to use the Fourier transform to analyze probability distributions. The mean and variance are simple multiples of the derivatives of $\hat{p}$ at zero: $\hat{p}'(0) = 0$, $\hat{p}''(0) = -4\pi^2$.

We Taylor expand $\hat{p}$ (need technical conditions on $p$):

\[ \hat{p}(y) = 1 + \frac{p''(0)}{2} y^2 + \cdots = 1 - 2\pi^2 y^2 + O(y^3). \]

Near the origin, the above shows $\hat{p}$ looks like a concave down parabola.
Appendix III: Proof of the Central Limit Theorem (cont)

- \( \text{Prob}(X_1 + \cdots + X_N \in [a, b]) = \int_a^b (p * \cdots * p)(z) \, dz. \)

- The Fourier transform converts convolution to multiplication. If \( \text{FT}[f](y) \) denotes the Fourier transform of \( f \) evaluated at \( y \):
  \[
  \text{FT}[p \ast \cdots \ast p](y) = \hat{p}(y) \cdots \hat{p}(y).
  \]

- Do not want the distribution of \( X_1 + \cdots + X_N = x \), but rather
  \[
  S_N = \frac{X_1 + \cdots + X_N}{\sqrt{N}} = x.
  \]

- If \( B(x) = A(cx) \) for some fixed \( c \neq 0 \), then \( \hat{B}(y) = \frac{1}{c} \hat{A}\left(\frac{y}{c}\right) \).

- \( \text{Prob}\left(\frac{X_1 + \cdots + X_N}{\sqrt{N}} = x\right) = (\sqrt{N}p \ast \cdots \ast \sqrt{N}p)(x\sqrt{N}). \)

- \( \text{FT}\left[(\sqrt{N}p \ast \cdots \ast \sqrt{N}p)(x\sqrt{N})\right](y) = \left[\hat{p}\left(\frac{y}{\sqrt{N}}\right)\right]^N. \)
Appendix III: Proof of the Central Limit Theorem (cont)

Can find the Fourier transform of the distribution of $S_N$:

$$\left[ \hat{p} \left( \frac{y}{\sqrt{N}} \right) \right]^N.$$

Take the limit as $N \to \infty$ for fixed $y$.

Know $\hat{p}(y) = 1 - 2\pi^2 y^2 + O(y^3)$. Thus study

$$\left[ 1 - \frac{2\pi^2 y^2}{N} + O \left( \frac{y^3}{N^{3/2}} \right) \right]^N.$$

For any fixed $y$,

$$\lim_{N \to \infty} \left[ 1 - \frac{2\pi^2 y^2}{N} + O \left( \frac{y^3}{N^{3/2}} \right) \right]^N = e^{-2\pi y^2}.$$

Fourier transform of $e^{-2\pi y^2}$ at $x$ is $\frac{1}{\sqrt{2\pi}} e^{-x^2/2}$. 
Appendix III: Proof of the Central Limit Theorem (cont)

We have shown:

- the Fourier transform of the distribution of \( S_N \) converges to \( e^{-2\pi y^2} \);
- the Fourier transform of \( e^{-2\pi y^2} \) is \( \frac{1}{\sqrt{2\pi}} e^{-x^2/2} \).

Therefore the distribution of \( S_N \) equalling \( x \) converges to \( \frac{1}{\sqrt{2\pi}} e^{-x^2/2} \).

We need complex analysis to justify this conclusion. Must be careful: Consider

\[
g(x) = \begin{cases} 
  e^{-1/x^2} & \text{if } x \neq 0 \\
  0 & \text{if } x = 0.
\end{cases}
\]

All the Taylor coefficients about \( x = 0 \) are zero, but the function is not identically zero in a neighborhood of \( x = 0 \).
Appendix IV: Best Fit Weibulls from Method of Maximum Likelihood

The likelihood function depends on: $\alpha_{RS}, \alpha_{RA}, \beta = -0.5, \gamma$. Let $A(\alpha, -0.5, \gamma, k)$ denote the area in $\text{Bin}(k)$ of the Weibull with parameters $\alpha, -0.5, \gamma$. The sample likelihood function $L(\alpha_{RS}, \alpha_{RA}, -0.5, \gamma)$ is

$$L(\alpha_{RS}, \alpha_{RA}, -0.5, \gamma) = \left(\frac{\text{#Games}}{RS_{obs}(1), \ldots, RS_{obs}(\text{#Bins})}\right)^{\text{#Bins}} \prod_{k=1}^{\text{#Bins}} A(\alpha_{RS}, -0.5, \gamma, k)^{RS_{obs}(k)} \cdot \left(\frac{\text{#Games}}{RA_{obs}(1), \ldots, RA_{obs}(\text{#Bins})}\right)^{\text{#Bins}} \prod_{k=1}^{\text{#Bins}} A(\alpha_{RA}, -0.5, \gamma, k)^{RA_{obs}(k)}.$$

For each team we find the values of the parameters $\alpha_{RS}, \alpha_{RA}$ and $\gamma$ that maximize the likelihood. Computationally, it is equivalent to maximize the logarithm of the likelihood, and we may ignore the multinomial coefficients as they are independent of the parameters.
