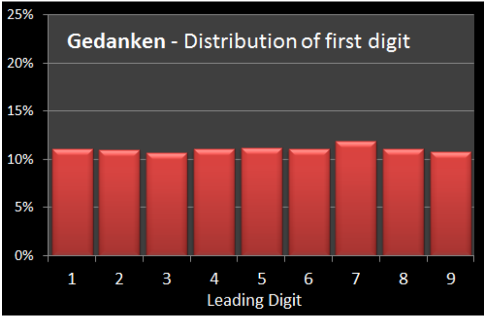
Interesting Question

Motivating Question: For a nice data set, such as the Fibonacci numbers, stock prices, street addresses of college employees and students, ..., what percent of the leading digits are 1?

Interesting Question

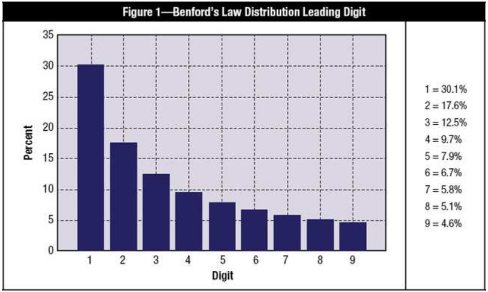
Motivating Question: For a nice data set, such as the Fibonacci numbers, stock prices, street addresses of college employees and students, ..., what percent of the leading digits are 1?



Natural guess: 10% (but immediately correct to 11%!).

Interesting Question

Motivating Question: For a nice data set, such as the Fibonacci numbers, stock prices, street addresses of college employees and students, ..., what percent of the leading digits are 1?



Answer: Benford's law!

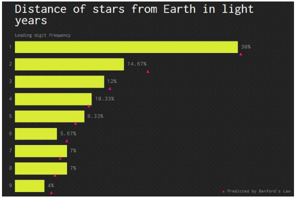
Distance of stars from Earth



Summary

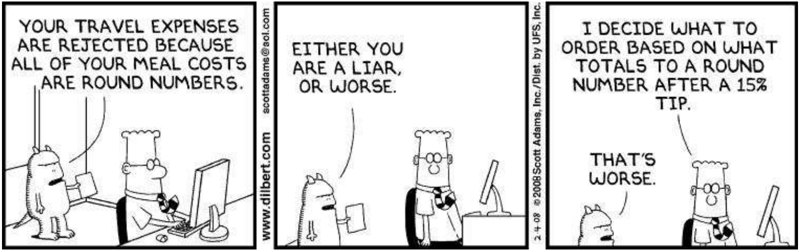
- Explain Benford's Law.
- Discuss examples and applications.
- Sketch proofs.
- Describe open problems.

Caveats!

- A math test indicating fraud is *not* proof of fraud: unlikely events, alternate reasons.

Caveats!

- A math test indicating fraud is *not* proof of fraud: unlikely events, alternate reasons.



Examples

- recurrence relations
- special functions (such as $n!$)
- iterates of power, exponential, rational maps
- products of random variables
- L-functions, characteristic polynomials
- iterates of the $3x+1$ map
- differences of order statistics
- hydrology and financial data
- many hierarchical Bayesian models

Applications

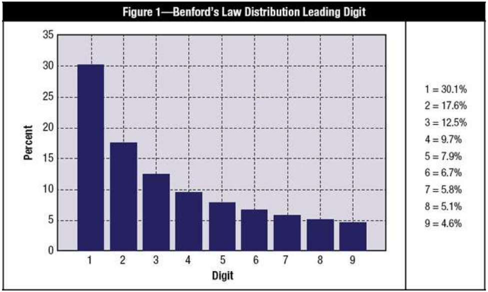
- Analyzing round-off errors.
- Determining the optimal way to store numbers.
- Detecting tax and image fraud, and data integrity.

General Theory

Benford's Law: Newcomb (1881), Benford (1938)

Statement

For many data sets, probability of observing a first digit of d base B is $\log_B\left(\frac{d+1}{d}\right)$; base 10 about 30% are 1s.



Benford's Law (probabilities)

Background Material

- Modulo: $a = b \mod c$ if $a - b$ is an integer times c; thus $17 = 5 \mod 12$, and $4.5 = .5 \mod 1$.

Background Material

- Modulo: $a = b \mod c$ if $a - b$ is an integer times c; thus $17 = 5 \mod 12$, and $4.5 = .5 \mod 1$.

- Significand: $x = S_{10}(x) \cdot 10^k$, k integer, $1 \leq S_{10}(x) < 10$.

Background Material

- Modulo: $a = b \mod c$ if $a - b$ is an integer times c; thus $17 = 5 \mod 12$, and $4.5 = .5 \mod 1$.

- Significand: $x = S_{10}(x) \cdot 10^k$, k integer, $1 \leq S_{10}(x) < 10$.

- $S_{10}(x) = S_{10}(\widetilde{x})$ if and only if x and $\widetilde{x}$ have the same leading digits. Note $\log_{10} x = \log_{10} S_{10}(x) + k$.

Background Material

- Modulo: $a = b \mod c$ if $a - b$ is an integer times c; thus $17 = 5 \mod 12$, and $4.5 = .5 \mod 1$.

- Significand: $x = S_{10}(x) \cdot 10^k$, k integer, $1 \le S_{10}(x) < 10$.

- $S_{10}(x) = S_{10}(\widetilde{x})$ if and only if x and $\widetilde{x}$ have the same leading digits. Note $\log_{10} x = \log_{10} S_{10}(x) + k$.

- Key observation: $\log_{10}(x) = \log_{10}(\widetilde{x}) \mod 1$ if and only if x and $\widetilde{x}$ have the same leading digits.

Thus often study $y = \log_{10} x \mod 1$.
Advanced: $e^{2\pi iu} = e^{2\pi i(u \bmod 1)}$.

Equidistribution and Benford's Law

Equidistribution

$\{y_n\}_{n=1}^{\infty}$ is equidistributed modulo 1 if probability $y_n \bmod 1 \in [a,b]$ tends to $b-a$:

$$\frac{\#\{n \le N : y_n \bmod 1 \in [a,b]\}}{N} \ \to \ b-a.$$

Equidistribution and Benford's Law

Equidistribution

$\{y_n\}_{n=1}^{\infty}$ is equidistributed modulo 1 if probability $y_n \bmod 1 \in [a,b]$ tends to $b-a$:

$$\frac{\#\{n \le N : y_n \bmod 1 \in [a,b]\}}{N} \to b-a.$$

- Thm: $\beta \notin \mathbb{Q}$, $n\beta$ is equidistributed mod 1.

Equidistribution and Benford's Law

Equidistribution

$\{y_n\}_{n=1}^{\infty}$ is equidistributed modulo 1 if probability $y_n \bmod 1 \in [a,b]$ tends to $b-a$:

$$\frac{\#\{n \le N : y_n \bmod 1 \in [a,b]\}}{N} \to b-a.$$

- Thm: $\beta \notin \mathbb{Q}$, $n\beta$ is equidistributed mod 1.
- Examples: $\log_{10} 2, \log_{10}\left(\frac{1+\sqrt{5}}{2}\right) \notin \mathbb{Q}$.

Equidistribution and Benford's Law

Equidistribution

$\{y_n\}_{n=1}^{\infty}$ is equidistributed modulo 1 if probability $y_n \bmod 1 \in [a,b]$ tends to $b-a$:

$$\frac{\#\{n \le N : y_n \bmod 1 \in [a,b]\}}{N} \to b-a.$$

- Thm: $\beta \notin \mathbb{Q}$, $n\beta$ is equidistributed mod 1.
- Examples: $\log_{10} 2, \log_{10}\left(\frac{1+\sqrt{5}}{2}\right) \notin \mathbb{Q}$.
  Proof: if rational: $2 = 10^{p/q}$.

Equidistribution and Benford's Law

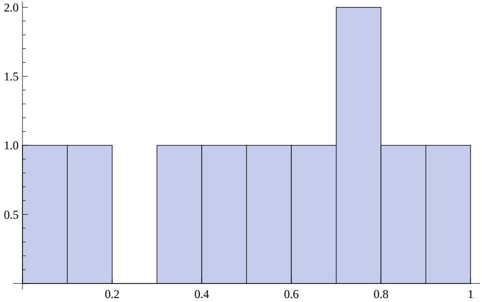
Equidistribution

$\{y_n\}_{n=1}^{\infty}$ is equidistributed modulo 1 if probability $y_n \bmod 1 \in [a, b]$ tends to $b - a$:

$$\frac{\#\{n \le N : y_n \bmod 1 \in [a, b]\}}{N} \to b - a.$$

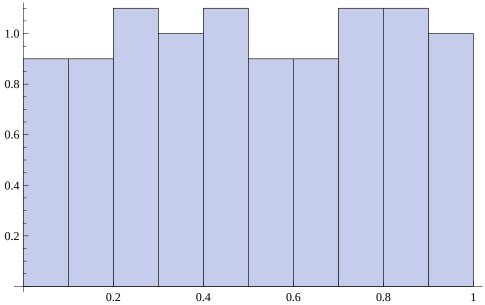
- Thm: $\beta \notin \mathbb{Q}$, $n\beta$ is equidistributed mod 1.
- Examples: $\log_{10} 2, \log_{10}\left(\frac{1+\sqrt{5}}{2}\right) \notin \mathbb{Q}$.
  Proof: if rational: $2 = 10^{p/q}$.
  Thus $2^q = 10^p$ or $2^{q-p} = 5^p$, impossible.

Example of Equidistribution: $n\sqrt{\pi}$ mod 1



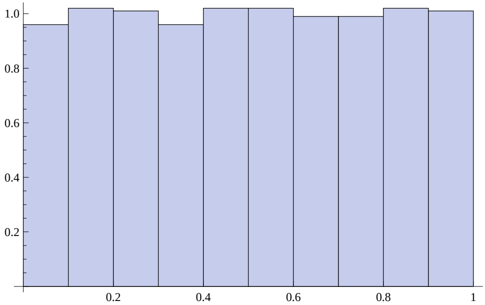
$n\sqrt{\pi}$ mod 1 for $n \leq 10$

Example of Equidistribution: $n\sqrt{\pi}$ mod 1



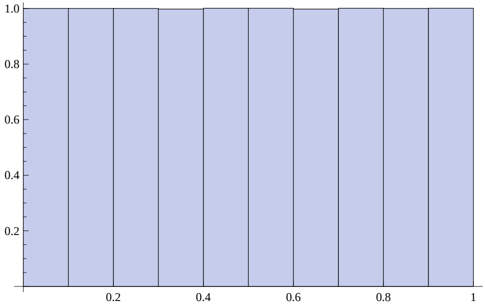
$n\sqrt{\pi}$ mod 1 for $n \leq 100$

Example of Equidistribution: $n\sqrt{\pi}$ mod 1



$n\sqrt{\pi}$ mod 1 for $n \leq 1000$

Example of Equidistribution: $n\sqrt{\pi}$ mod 1



$n\sqrt{\pi}$ mod 1 for $n \le 10,000$

Logarithms and Benford's Law

Fundamental Equivalence

Data set $\{x_i\}$ is Benford base B if $\{y_i\}$ is equidistributed mod 1, where $y_i = \log_B x_i$.

Logarithms and Benford's Law

Fundamental Equivalence

Data set $\{x_i\}$ is Benford base B if $\{y_i\}$ is equidistributed mod 1, where $y_i = \log_B x_i$.

$$x = S_{10}(x) \cdot 10^k \text{ then}$$
$$\log_{10} x = \log_{10} S_{10}(x) + k = \log_{10} S_{10}x \bmod 1.$$

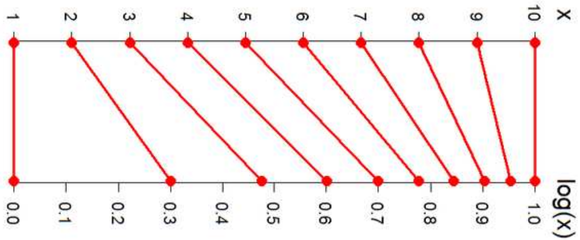
Logarithms and Benford's Law

Fundamental Equivalence

Data set $\{x_i\}$ is Benford base B if $\{y_i\}$ is equidistributed mod 1, where $y_i = \log_B x_i$.

$$x = S_{10}(x) \cdot 10^k \text{ then}$$

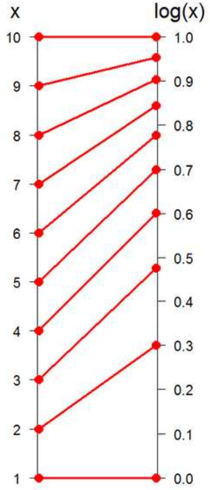
$$\log_{10} x = \log_{10} S_{10}(x) + k = \log_{10} S_{10} x \text{ mod } 1.$$



Logarithms and Benford's Law

$$\begin{aligned}\text{Prob}(\text{leading digit } d) &= \log_{10}(d+1) - \log_{10}(d) \\ &= \log_{10}\left(\frac{d+1}{d}\right) \\ &= \log_{10}\left(1+\frac{1}{d}\right).\end{aligned}$$

Have Benford's law $\leftrightarrow$ mantissa of logarithms of data are uniformly distributed



Examples

- 2^n is Benford base 10 as $\log_{10} 2 \notin \mathbb{Q}$.

Examples

- Fibonacci numbers are Benford base 10.

Examples

- Fibonacci numbers are Benford base 10.
  $a_{n+1} = a_n + a_{n-1}$.

Examples

- Fibonacci numbers are Benford base 10.

  $a_{n+1} = a_n + a_{n-1}$.

  Guess $a_n = r^n$: $r^{n+1} = r^n + r^{n-1}$ or $r^2 = r + 1$.

Examples

- Fibonacci numbers are Benford base 10.
  $a_{n+1} = a_n + a_{n-1}$.
  Guess $a_n = r^n$: $r^{n+1} = r^n + r^{n-1}$ or $r^2 = r + 1$.
  Roots $r = (1 \pm \sqrt{5})/2$.

Examples

- Fibonacci numbers are Benford base 10.

  $a_{n+1} = a_n + a_{n-1}$.

  Guess $a_n = r^n$: $r^{n+1} = r^n + r^{n-1}$ or $r^2 = r + 1$.

  Roots $r = (1 \pm \sqrt{5})/2$.

  General solution: $a_n = c_1 r_1^n + c_2 r_2^n$.

Examples

- Fibonacci numbers are Benford base 10.

  $a_{n+1} = a_n + a_{n-1}$.

  Guess $a_n = r^n$: $r^{n+1} = r^n + r^{n-1}$ or $r^2 = r + 1$.

  Roots $r = (1 \pm \sqrt{5})/2$.

  General solution: $a_n = c_1 r_1^n + c_2 r_2^n$.

  Binet: $a_n = \frac{1}{\sqrt{5}} \left(\frac{1+\sqrt{5}}{2}\right)^n - \frac{1}{\sqrt{5}} \left(\frac{1-\sqrt{5}}{2}\right)^n$.

Examples

- Fibonacci numbers are Benford base 10.

  $a_{n+1} = a_n + a_{n-1}$.
  Guess $a_n = r^n$: $r^{n+1} = r^n + r^{n-1}$ or $r^2 = r + 1$.
  Roots $r = (1 \pm \sqrt{5})/2$.
  General solution: $a_n = c_1 r_1^n + c_2 r_2^n$.
  Binet: $a_n = \frac{1}{\sqrt{5}}\left(\frac{1+\sqrt{5}}{2}\right)^n - \frac{1}{\sqrt{5}}\left(\frac{1-\sqrt{5}}{2}\right)^n$.

- Most linear recurrence relations Benford:

Examples

- Fibonacci numbers are Benford base 10.

  $a_{n+1} = a_n + a_{n-1}$.
  Guess $a_n = r^n$: $r^{n+1} = r^n + r^{n-1}$ or $r^2 = r + 1$.
  Roots $r = (1 \pm \sqrt{5})/2$.
  General solution: $a_n = c_1 r_1^n + c_2 r_2^n$.
  Binet: $a_n = \frac{1}{\sqrt{5}}\left(\frac{1+\sqrt{5}}{2}\right)^n - \frac{1}{\sqrt{5}}\left(\frac{1-\sqrt{5}}{2}\right)^n$.

- Most linear recurrence relations Benford:
  - ◇ $a_{n+1} = 2a_n$

Examples

- Fibonacci numbers are Benford base 10.

  $a_{n+1} = a_n + a_{n-1}$.

  Guess $a_n = r^n$: $r^{n+1} = r^n + r^{n-1}$ or $r^2 = r + 1$.

  Roots $r = (1 \pm \sqrt{5})/2$.

  General solution: $a_n = c_1 r_1^n + c_2 r_2^n$.

  Binet: $a_n = \frac{1}{\sqrt{5}}\left(\frac{1+\sqrt{5}}{2}\right)^n - \frac{1}{\sqrt{5}}\left(\frac{1-\sqrt{5}}{2}\right)^n$.

- Most linear recurrence relations Benford:
  - ◇ $a_{n+1} = 2a_n - a_{n-1}$

Examples

- Fibonacci numbers are Benford base 10.
  $a_{n+1} = a_n + a_{n-1}$.
  Guess $a_n = r^n$: $r^{n+1} = r^n + r^{n-1}$ or $r^2 = r + 1$.
  Roots $r = (1 \pm \sqrt{5})/2$.
  General solution: $a_n = c_1 r_1^n + c_2 r_2^n$.
  Binet: $a_n = \frac{1}{\sqrt{5}}\left(\frac{1+\sqrt{5}}{2}\right)^n - \frac{1}{\sqrt{5}}\left(\frac{1-\sqrt{5}}{2}\right)^n$.

- Most linear recurrence relations Benford:
  - ◇ $a_{n+1} = 2a_n - a_{n-1}$
  - ◇ take $a_0 = a_1 = 1$ or $a_0 = 0$, $a_1 = 1$.

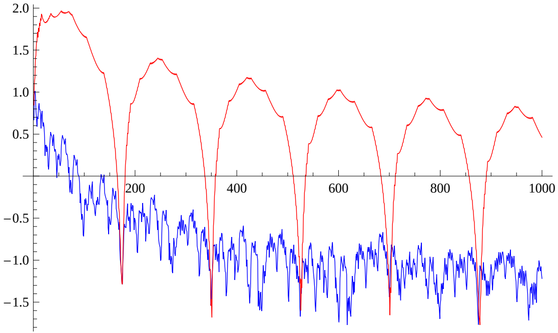
700	0.19	0.04	0.05
800	0.04	0.03	6.19
900	0.09	0.09	1.71
1000	0.02	0.06	2.90

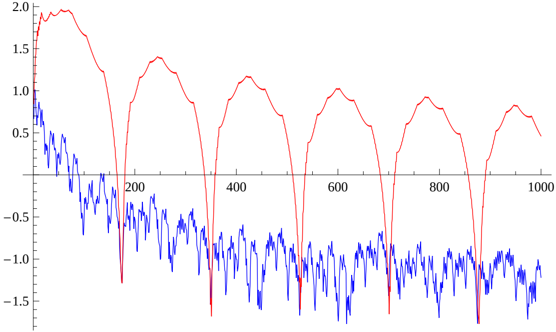
Logarithms and Benford's Law: Base 10 (5%: $\log(\chi^2) \approx 2.74$)

$\log(\chi^2)$ vs N for π^n (red) and e^n (blue), $n \in \{1, \dots, N\}$.



Logarithms and Benford's Law: Base 10 (5%: $\log(\chi^2) \approx 2.74$)

$\log(\chi^2)$ vs N for π^n (red) and e^n (blue), $n \in \{1, \dots, N\}$. Note $\pi^{175} \approx 1.0028 \cdot 10^{87}$.



Why Benford's Law?

Streets

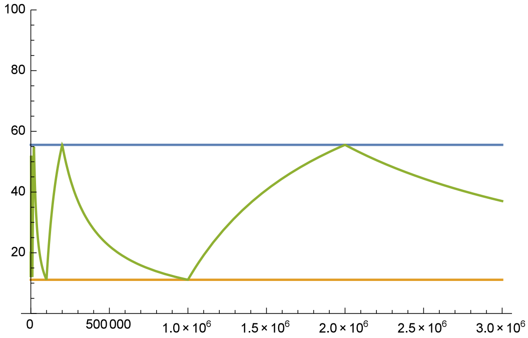
Not all data sets satisfy Benford's Law.

- Long street $[1, L]$: $L = 199$ versus $L = 999$.
- Oscillates b/w $1/9$ and $5/9$ with first digit 1.

Streets

Not all data sets satisfy Benford's Law.

- Long street $[1, L]$: $L = 199$ versus $L = 999$.
- Oscillates b/w $1/9$ and $5/9$ with first digit 1.

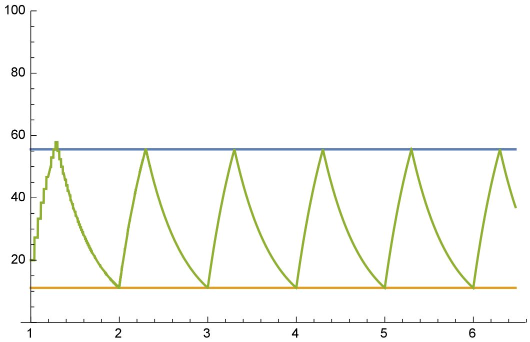


Probability first digit 1 versus street length L.

Streets

Not all data sets satisfy Benford's Law.

- Long street $[1, L]$: $L = 199$ versus $L = 999$.
- Oscillates b/w $1/9$ and $5/9$ with first digit 1.

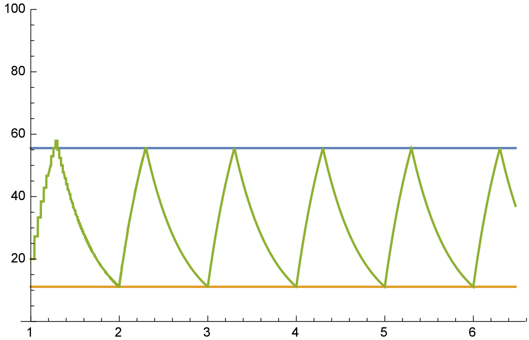


Probability first digit 1 versus log(street length L).

Streets

Not all data sets satisfy Benford's Law.

- Long street $[1, L]$: $L = 199$ versus $L = 999$.
- Oscillates b/w $1/9$ and $5/9$ with first digit 1.



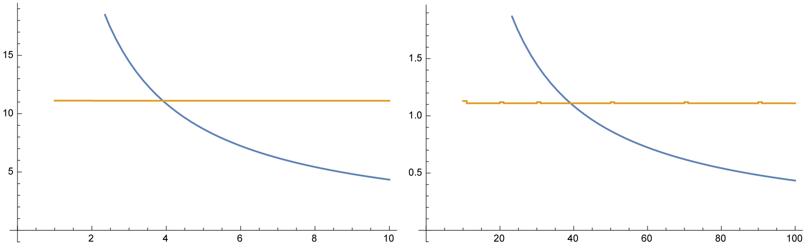
Probability first digit 1 versus log(street length L).

What if we have many streets of different lengths?

Amalgamating Streets

All houses: 1000 Streets,

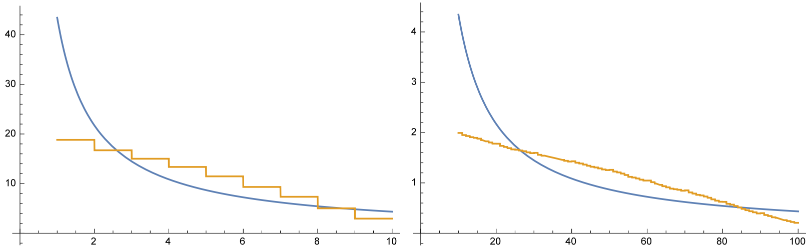
each from 1 to 10000.



First digit and first two digits vs Benford.

Amalgamating Streets

All houses: 1000 Streets,
each from 1 to rand(10000).

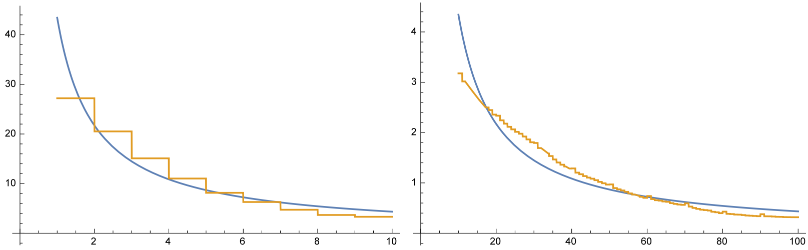


First digit and first two digits vs Benford.

Amalgamating Streets

All houses: 1000 Streets,

each 1 to rand(rand(10000)).



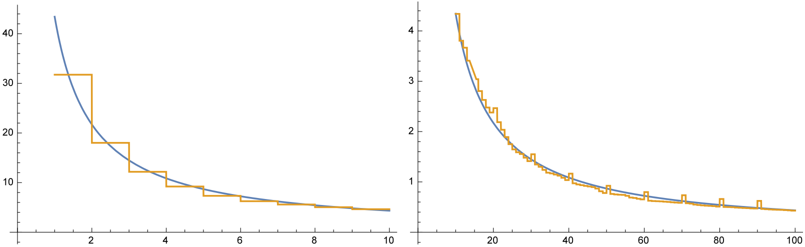
First digit and first two digits vs Benford.

Conclusion: More processes, closer to Benford.

Amalgamating Streets

All houses: 1000 Streets,

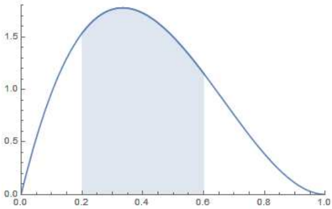
each 1 to rand(rand(rand(10000))).



First digit and first two digits vs Benford.

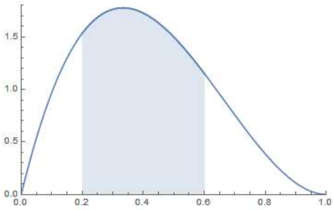
Conclusion: More processes, closer to Benford.

Probability Review



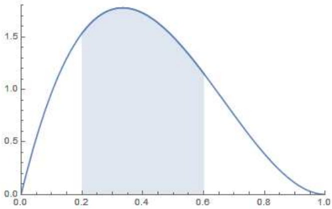
- Let X be random variable with density $p(x)$:
  - $\diamond$ $p(x) \geq 0$; $\int_{-\infty}^{\infty} p(x)\mathrm{d}x = 1$;
  - $\diamond$ $\mathrm{Prob}\,(a \leq X \leq b) = \int_a^b p(x)\mathrm{d}x$.

Probability Review



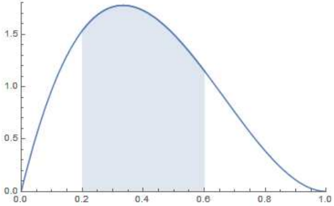
- Let X be random variable with density $p(x)$:
  - ◇ $p(x) \geq 0$; $\int_{-\infty}^{\infty} p(x)\mathrm{d}x = 1$;
  - ◇ $\mathrm{Prob}\,(a \leq X \leq b) = \int_a^b p(x)\mathrm{d}x$.
- Mean $\mu = \int_{-\infty}^{\infty} xp(x)\mathrm{d}x$.

Probability Review



- Let X be random variable with density $p(x)$:
  - ◇ $p(x) \geq 0$; $\int_{-\infty}^{\infty} p(x)\mathrm{d}x = 1$;
  - ◇ $\mathrm{Prob}\,(a \leq X \leq b) = \int_a^b p(x)\mathrm{d}x$.
- Mean $\mu = \int_{-\infty}^{\infty} xp(x)\mathrm{d}x$.
- Variance $\sigma^2 = \int_{-\infty}^{\infty} (x-\mu)^2 p(x)\mathrm{d}x$.

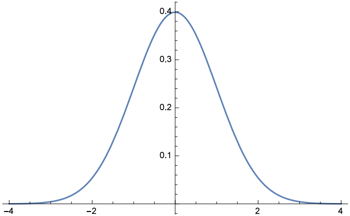
Probability Review



- Let X be random variable with density $p(x)$:
  - $\diamond$ $p(x) \geq 0$; $\int_{-\infty}^{\infty} p(x) dx = 1$;
  - $\diamond$ $\text{Prob}\,(a \leq X \leq b) = \int_a^b p(x) dx$.
- Mean $\mu = \int_{-\infty}^{\infty} x p(x) dx$.
- Variance $\sigma^2 = \int_{-\infty}^{\infty} (x-\mu)^2 p(x) dx$.
- Independence: knowledge of one random variable gives no knowledge of the other.

Central Limit Theorem

$$\text{Normal } N(\mu,\sigma^2):\ p(x) = e^{-(x-\mu)^2/2\sigma^2}/\sqrt{2\pi\sigma^2}.$$



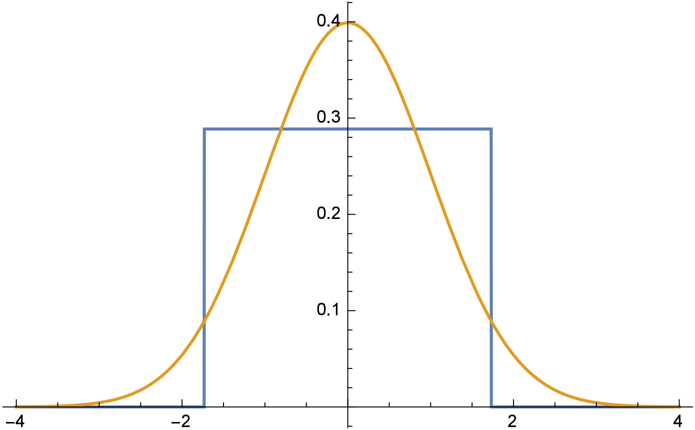
Theorem

If $X_1, X_2, \dots$ independent, identically distributed random variables (mean μ, variance σ^2, finite moments) then

$$S_N := \frac{X_1 + \cdots + X_N - N\mu}{\sigma\sqrt{N}} \text{ converges to } N(0,1).$$

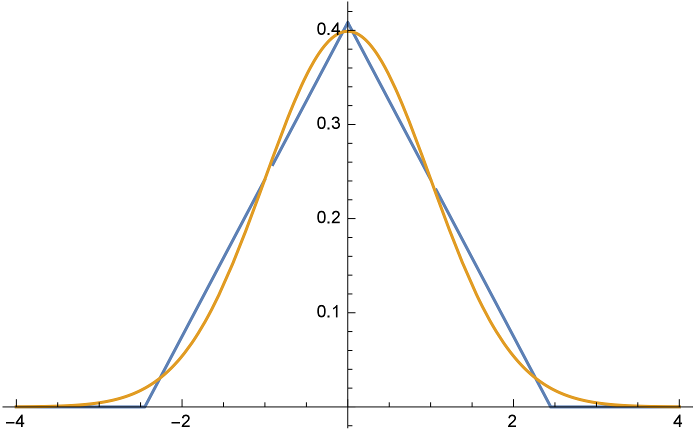
Central Limit Theorem: Sums of Uniform Random Variables
$X_i \sim \text{Unif}(-1/2, 1/2)$ (adjusted to mean 0, variance 1)

$$Y_1 = X_1/\sigma_{X_1} \text{ vs } N(0,1).$$



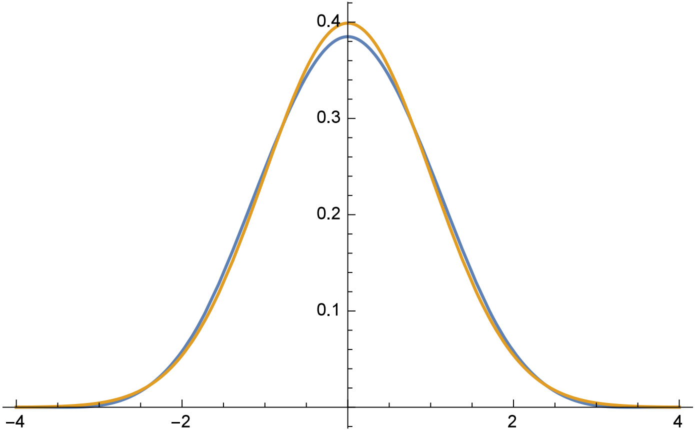
Central Limit Theorem: Sums of Uniform Random Variables $X_i \sim \mathrm{Unif}(-1/2, 1/2)$ (adjusted to mean 0, variance 1)

$Y_2 = (X_1 + X_2)/\sigma_{X_1+X_2}$ vs $N(0,1)$.



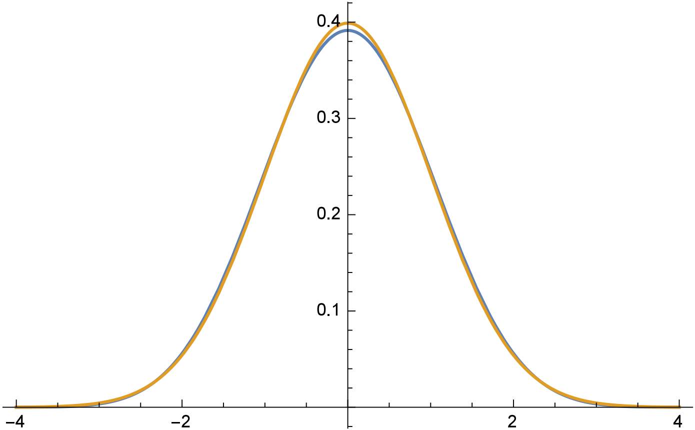
Central Limit Theorem: Sums of Uniform Random Variables $X_i \sim \mathrm{Unif}(-1/2, 1/2)$ (adjusted to mean 0, variance 1)

$$Y_4 = (X_1 + X_2 + X_3 + X_4)/\sigma_{X_1+X_2+X_3+X_4} \text{ vs } N(0,1).$$



Central Limit Theorem: Sums of Uniform Random Variables $X_i \sim \mathrm{Unif}(-1/2, 1/2)$ (adjusted to mean 0, variance 1)

$$Y_8 = (X_1 + \cdots + X_8)/\sigma_{X_1+\cdots+X_8} \text{ vs } N(0,1).$$



Central Limit Theorem: Sums of Uniform Random Variables $X_i \sim \mathrm{Unif}(-1/2, 1/2)$ (adjusted to mean 0, variance 1)

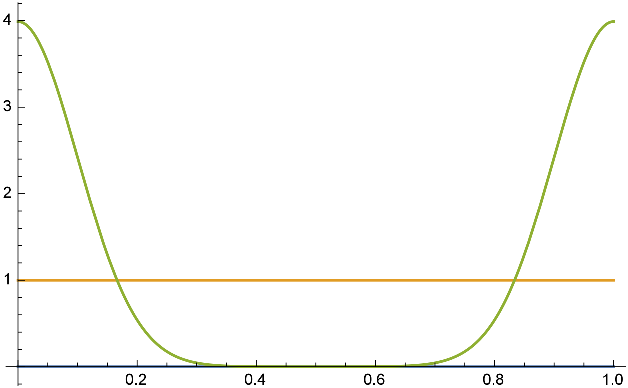
Density of $Y_4 = (X_1 + \cdots + X_4)/\sigma_{X_1+\cdots+X_4}$.

$$\frac{\begin{cases} \frac{1}{27}\left(18 + 9\sqrt{3}\,y - \sqrt{3}\,y^3\right) & y == 0 \\ \frac{1}{18}\left(12 - 6y^2 - \sqrt{3}\,y^3\right) & -\sqrt{3} < y < 0 \\ \frac{1}{54}\left(72 - 36\sqrt{3}\,y + 18y^2 - \sqrt{3}\,y^3\right) & \sqrt{3} < y < 2\sqrt{3} \\ \frac{1}{54}\left(18\sqrt{3}\,y - 18y^2 + \sqrt{3}\,y^3\right) & y == \sqrt{3} \\ \frac{1}{18}\left(12 - 6y^2 + \sqrt{3}\,y^3\right) & 0 < y < \sqrt{3} \\ \frac{1}{54}\left(72 + 36\sqrt{3}\,y + 18y^2 + \sqrt{3}\,y^3\right) & -2\sqrt{3} < y \le -\sqrt{3} \\ 0 & \mathrm{True} \end{cases}}{\sqrt{3}}$$

(Don't even think of asking to see Y_8's!)

Normal Distributions Mod 1

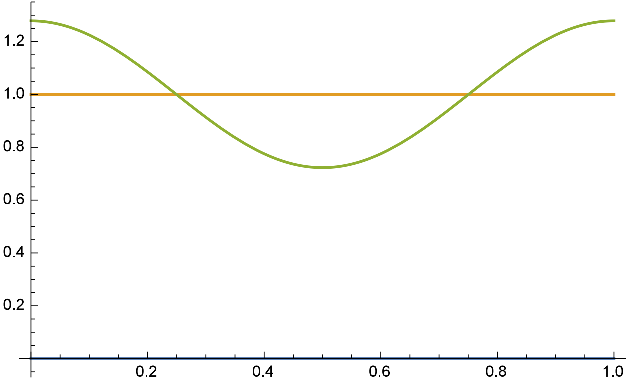
As $\sigma \to \infty$, $N(0, \sigma^2)$ mod 1 $\to \mathrm{Unif}(0, 1)$.



Variance is .01.

Normal Distributions Mod 1

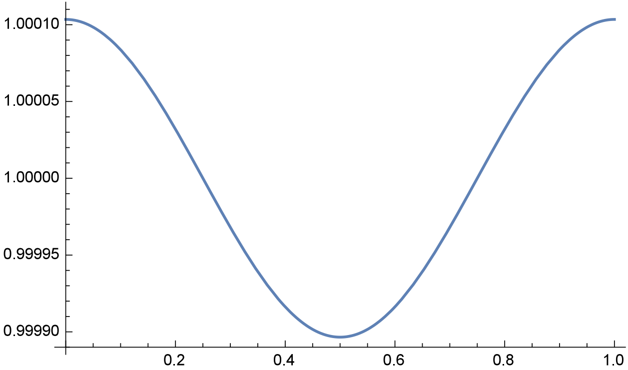
As $\sigma \to \infty$, $N(0,\sigma^2)$ mod 1 $\to \mathrm{Unif}(0,1)$.



Variance is .1.

Normal Distributions Mod 1

As $\sigma \to \infty$, $N(0, \sigma^2)$ mod 1 $\to \text{Unif}(0, 1)$.



Variance is .5.

Products and Benford's Law

Pavlovian Response: See a product, take a logarithm.

$X_1, X_2, \ldots$ nice, $W_N = X_1 \cdot X_2 \cdots X_N$.

$Y_i = \log_{10} X_i$, $V_N := \log_{10} W_N$.

$$\begin{aligned} V_N &= \log_{10}(X_1 \cdot X_2 \cdots X_N) \\ &= \log_{10} X_1 + \log_{10} X_2 + \cdots + \log_{10} X_N \\ &= Y_1 + Y_2 + \cdots + Y_N. \end{aligned}$$

Need distribution of V_N mod 1, which by CLT becomes uniform, implying Benfordness!

Applications

Applications for the IRS: Detecting Fraud

A Tale of Two Steve Millers....

Detecting Fraud

Bank Fraud

- Audit of a bank revealed huge spike of numbers starting with

Detecting Fraud

Bank Fraud

- Audit of a bank revealed huge spike of numbers starting with 4

Detecting Fraud

Bank Fraud

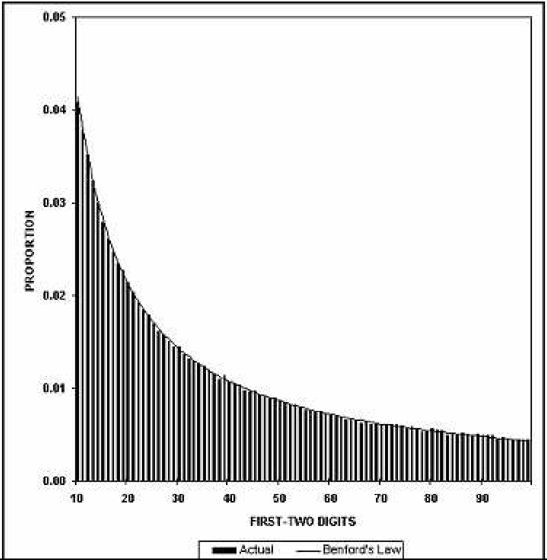
- Audit of a bank revealed huge spike of numbers starting with 48 and 49, most due to one person.

Detecting Fraud

Bank Fraud

- Audit of a bank revealed huge spike of numbers starting with 48 and 49, most due to one person.
- Write-off limit of $5,000. Officer had friends applying for credit cards, ran up balances just under $5,000 then he would write the debts off.

Data Integrity: Stream Flow Statistics: 130 years, 457,440 records



Applications

- Analyzing round-off errors.
- Determining the optimal way to store numbers.
- Detecting tax and image fraud, and data integrity.

Stick Decomposition

Fixed Proportion Decomposition Process

Decomposition Process

1. Consider a stick of length $\mathcal{L}$.

Fixed Proportion Decomposition Process

Decomposition Process

1. Consider a stick of length $\mathcal{L}$.
2. Uniformly choose a proportion $p \in (0, 1)$.

Fixed Proportion Decomposition Process

Decomposition Process

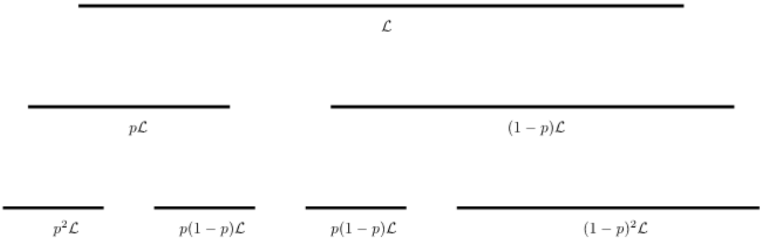
1. Consider a stick of length $\mathcal{L}$.
2. Uniformly choose a proportion $p \in (0,1)$.
3. Break the stick into two pieces—lengths $p\mathcal{L}$ and $(1-p)\mathcal{L}$.

Fixed Proportion Decomposition Process

Decomposition Process

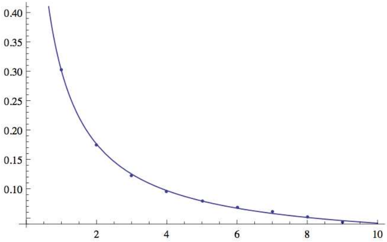
1. Consider a stick of length $\mathcal{L}$.
2. Uniformly choose a proportion $p \in (0,1)$.
3. Break the stick into two pieces—lengths $p\mathcal{L}$ and $(1-p)\mathcal{L}$.
4. Repeat N times (using the same proportion).

Fixed Proportion Decomposition Process

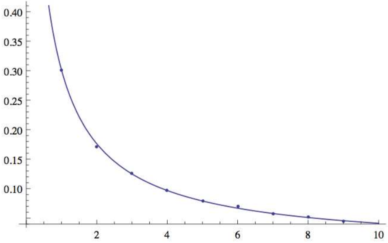


Fixed Proportion Conjecture (Joy Jing ’13)

Conjecture: The above decomposition process is Benford as $N \to \infty$ for any $p \in (0,1)$, $p \neq \frac{1}{2}$.



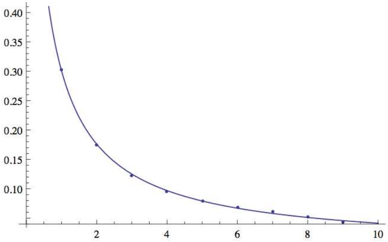
(B) $p = 0.51$ and $N = 10000$.



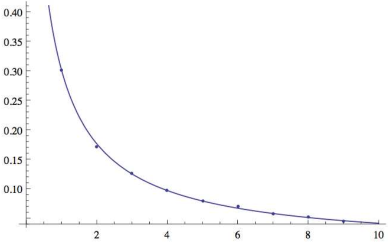
(B) $p = 0.99$ and $N = 50000$. Benford distribution overlaid.

Fixed Proportion Conjecture (Joy Jing '13)

Conjecture: The above decomposition process is Benford as $N \to \infty$ for any $p \in (0, 1)$, $p \neq \frac{1}{2}$.



(B) $p = 0.51$ and $N = 10000$.



(B) $p = 0.99$ and $N = 50000$. Benford distribution overlaid.

Counterexample (SMALL REU '13): $p = \frac{1}{11}$, $1 - p = \frac{10}{11}$.

Benford Analysis

At N^{th} level,

- 2^N sticks
- $N+1$ distinct lengths:

$$p^N\left(\frac{1-p}{p}\right)^j,\ \ j\in\{0,\dots,N\},\ \text{have}\ \binom{N}{j}\ \text{times.}$$

Benford Analysis

At N^{th} level,

- 2^N sticks
- $N+1$ distinct lengths:

$$p^N\left(\frac{1-p}{p}\right)^j,\ j\in\{0,\dots,N\},\ \text{have}\ \binom{N}{j}\ \text{times.}$$

(Weighted) Geometric with ratio $\frac{1-p}{p}=10^y$;
behavior depends on irrationality of y!

Benford Analysis

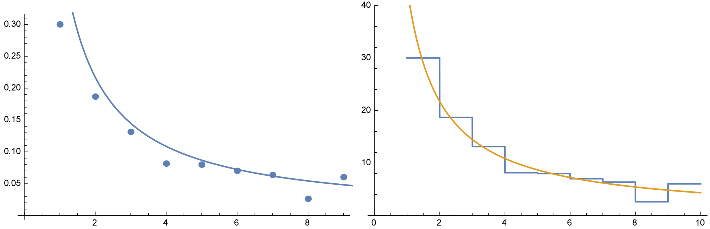
At N^{th} level,

- 2^N sticks
- $N+1$ distinct lengths:

$$p^N\left(\frac{1-p}{p}\right)^j,\ j\in\{0,\dots,N\},\ \text{have}\ \binom{N}{j}\ \text{times.}$$

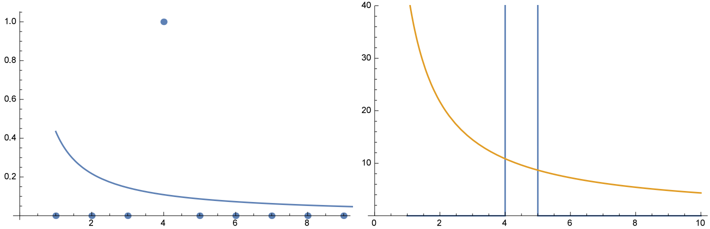
(Weighted) Geometric with ratio $\frac{1-p}{p}=10^y$;
behavior depends on irrationality of y!
Theorem: Benford if and only if y irrational.

Examples



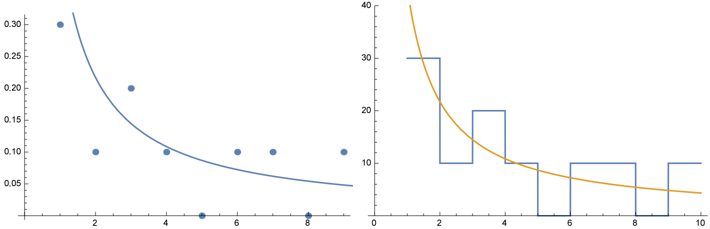
$p = 3/11$, 1000 levels; $y = \log_{10}(8/3) \notin \mathbb{Q}$ (irrational)

Examples



$p = 1/11$, 1000 levels; $y = 1 \in \mathbb{Q}$ (rational)

Examples



$p = 1/(1+10^{33/10})$, 1000 levels; $y = 33/10 \in \mathbb{Q}$ (rational)

The $3x + 1$ Problem and Benford's Law

$3x + 1$ Problem

- Kakutani (conspiracy), Erdös (not ready).
- x odd, $T(x) = \frac{3x+1}{2^k}$, $2^k || 3x + 1$.
- Conjecture: for some $n = n(x)$, $T^n(x) = 1$.

$3x + 1$ Problem

- Kakutani (conspiracy), Erdös (not ready).
- x odd, $T(x) = \frac{3x+1}{2^k}$, $2^k || 3x + 1$.
- Conjecture: for some $n = n(x)$, $T^n(x) = 1$.
- 7

$3x + 1$ Problem

- Conjecture: for some $n = n(x)$, $T^n(x) = 1$.
- $7 \to_1 11 \to_1 17 \to_2 13 \to_3 5 \to_4 1 \to_2 1$,
  2-path $(1,1)$, 5-path $(1,1,2,3,4)$.
  m-path: $(k_1, \dots, k_m)$.

Heuristic Proof of $3x+1$ Conjecture

$$
\begin{aligned}
a_{n+1} &= T(a_n) \\
\mathbb{E}[\log a_{n+1}] &\approx \sum_{k=1}^{\infty} \frac{1}{2^k} \log\left(\frac{3a_n}{2^k}\right) \\
&= \log a_n + \log 3 - \log 2 \sum_{k=1}^{\infty} \frac{k}{2^k} \\
&= \log a_n + \log\left(\frac{3}{4}\right).
\end{aligned}
$$

Geometric Brownian Motion, drift $\log(3/4) < 1$.

$3x + 1$ and Benford

Theorem (Kontorovich and M–, 2005)

As $m \to \infty$, $x_m/(3/4)^m x_0$ is Benford.

Theorem (Lagarias-Soundararajan, 2006)

$X \geq 2^N$, for all but at most $c(B)N^{-1/36}X$ initial seeds the distribution of the first N iterates of the $3x+1$ map are within $2N^{-1/36}$ of the Benford probabilities.

Structure Theorem: Sinai, Kontorovich-Sinai

$$\mathbb{P}(A) = \lim_{N\to\infty} \frac{\#\{n\le N : n\equiv 1,5 \bmod 6, n\in A\}}{\#\{n\le N : n\equiv 1,5 \bmod 6\}}.$$

$(k_1, \dots, k_m)$: two full arithm progressions:

$6 \cdot 2^{k_1+\cdots+k_m} p + q$.

Theorem (Sinai, Kontorovich-Sinai)

k_i-values are i.i.d.r.v. (geometric, $1/2$):

Structure Theorem: Sinai, Kontorovich-Sinai

$$\mathbb{P}(A) = \lim_{N\to\infty} \frac{\#\{n\le N : n\equiv 1,5 \bmod 6, n\in A\}}{\#\{n\le N : n\equiv 1,5 \bmod 6\}}.$$

$(k_1,\dots,k_m)$: two full arithm progressions:

$6\cdot 2^{k_1+\cdots+k_m}p+q$.

Theorem (Sinai, Kontorovich-Sinai)

k_i-values are i.i.d.r.v. (geometric, $1/2$):

$$\mathbb{P}\left(\frac{\log_2\left[\frac{x_m}{\left(\frac{3}{4}\right)^m x_0}\right]}{\sqrt{2m}} \le a\right) = \mathbb{P}\left(\frac{S_m-2m}{\sqrt{2m}} \le a\right)$$

Structure Theorem: Sinai, Kontorovich-Sinai

$\mathbb{P}(A) = \lim_{N\to\infty} \frac{\#\{n\le N: n\equiv 1,5 \bmod 6, n\in A\}}{\#\{n\le N: n\equiv 1,5 \bmod 6\}}$.

$(k_1,\dots,k_m)$: two full arithm progressions:

$6\cdot 2^{k_1+\cdots+k_m}p+q$.

Theorem (Sinai, Kontorovich-Sinai)

k_i-values are i.i.d.r.v. (geometric, $1/2$):

$$\mathbb{P}\left(\frac{\log_2\left[\frac{x_m}{\left(\frac{3}{4}\right)^m x_0}\right]}{(\log_2 B)\sqrt{2m}} \le a\right) = \mathbb{P}\left(\frac{S_m - 2m}{(\log_2 B)\sqrt{2m}} \le a\right)$$

Structure Theorem: Sinai, Kontorovich-Sinai

$\mathbb{P}(A) = \lim_{N\to\infty} \frac{\#\{n\le N: n\equiv 1,5 \bmod 6, n\in A\}}{\#\{n\le N: n\equiv 1,5 \bmod 6\}}$.

$(k_1, \dots, k_m)$: two full arithm progressions: $6 \cdot 2^{k_1+\cdots+k_m} p + q$.

Theorem (Sinai, Kontorovich-Sinai)

k_i-values are i.i.d.r.v. (geometric, $1/2$):

$$\mathbb{P}\left(\frac{\log_B\left[\frac{x_m}{\left(\frac{3}{4}\right)^m x_0}\right]}{\sqrt{2m}} \le a\right) = \mathbb{P}\left(\frac{\frac{(S_m - 2m)}{\log_2 B}}{\sqrt{2m}} \le a\right)$$

Sketch of the proof of Benfordness

- Failed Proof: lattices, bad errors.

- CLT: $(S_m - 2m)/\sqrt{2m} \to N(0,1)$:
$$\mathbb{P}(S_m - 2m = k) = \frac{\eta(k/\sqrt{m})}{\sqrt{m}} + O\left(\frac{1}{g(m)\sqrt{m}}\right).$$

- Quantified Equidistribution:
$I_\ell = \{\ell M, \dots, (\ell+1)M - 1\}$, $M = m^c$, $c < 1/2$
$k_1, k_2 \in I_\ell$: $\left|\eta\left(\frac{k_1}{\sqrt{m}}\right) - \eta\left(\frac{k_2}{\sqrt{m}}\right)\right|$ small
$C = \log_B 2$ of irrationality type $\kappa < \infty$:
$$\#\{k \in I_\ell : \overline{kC} \in [a,b]\} = M(b-a) + O(M^{1+\epsilon-1/\kappa}).$$

Irrationality Type

Irrationality type

α has irrationality type κ if κ is the supremum of all γ with

$$\underline{\lim}_{q\to\infty} q^{\gamma+1} \min_p \left|\alpha - \frac{p}{q}\right| = 0.$$

- Algebraic irrationals: type 1 (Roth's Thm).
- Theory of Linear Forms: $\log_B 2$ of finite type.

Linear Forms

Theorem (Baker)

$\alpha_1, \dots, \alpha_n$ algebraic numbers height $A_j \geq 4$, $\beta_1, \dots, \beta_n \in \mathbb{Q}$ with height at most $B \geq 4$,

$$\Lambda = \beta_1 \log \alpha_1 + \cdots + \beta_n \log \alpha_n.$$

If $\Lambda \neq 0$ then $|\Lambda| > B^{-C\Omega \log \Omega'}$, with $d = [\mathbb{Q}(\alpha_i, \beta_j) : \mathbb{Q}]$, $C = (16nd)^{200n}$, $\Omega = \prod_j \log A_j$, $\Omega' = \Omega / \log A_n$.

Gives $\log_{10} 2$ of finite type, with $\kappa < 1.2 \cdot 10^{602}$:

$$|\log_{10} 2 - p/q| = |q \log 2 - p \log 10| / q \log 10.$$

Quantified Equidistribution

Theorem (Erdös-Turan)

$$D_N = \frac{\sup_{[a,b]} |N(b-a) - \#\{n \le N : x_n \in [a,b]\}|}{N}$$

There is a C such that for all m:

$$D_N \le C \cdot \left(\frac{1}{m} + \sum_{h=1}^{m} \frac{1}{h} \left| \frac{1}{N} \sum_{n=1}^{N} e^{2\pi i h x_n} \right| \right)$$

Proof of Erdös-Turan

Consider special case $x_n = n\alpha$, $\alpha \notin \mathbb{Q}$.

- Exponential sum $\le \frac{1}{|\sin(\pi h\alpha)|} \le \frac{1}{2||h\alpha||}$.
- Must control $\sum_{h=1}^{m} \frac{1}{h||h\alpha||}$, see irrationality type enter.
- type κ, $\sum_{h=1}^{m} \frac{1}{h||h\alpha||} = O\left(m^{\kappa-1+\epsilon}\right)$, take $m = \lfloor N^{1/\kappa} \rfloor$.

$3x+1$ Data: random 10,000 digit number, $2^k||3x+1$

80,514 iterations ($(4/3)^n = a_0$ predicts 80,319);
$\chi^2 = 13.5$ (5% 15.5).

Conclusions

Current / Future Investigations

- Develop more sophisticated tests for fraud.
- Study digits of other systems.
  ◇ Break rods of variable integer length, each piece breaks until is a prime, or a square, ...
  ◇ Fragmentation models in higher dimensions.

Conclusions and Future Investigations

- See many different systems exhibit Benford behavior.
- Ingredients of proofs (logarithms, equidistribution).
- Applications to fraud detection / data integrity.

The Riemann Zeta Function $\zeta(s)$ and Benford's Law

Riemann Zeta Function (for real part of s greater than 1)

$$\zeta(s) \;=\; \sum_{n=1}^{\infty} \frac{1}{n^s}$$

Riemann Zeta Function (for real part of s greater than 1)

$$\zeta(s) \;=\; \sum_{n=1}^{\infty} \frac{1}{n^s} \;=\; \prod_{p \text{ prime}} \left(1 - \frac{1}{p^s}\right)^{-1}, \quad \mathrm{Re}(s) > 1.$$

Riemann Zeta Function (for real part of s greater than 1)

$$\zeta(s) = \sum_{n=1}^{\infty} \frac{1}{n^s} = \prod_{p \text{ prime}} \left(1 - \frac{1}{p^s}\right)^{-1}, \quad \mathrm{Re}(s) > 1.$$

Geometric Series Formula: $(1-x)^{-1} = 1 + x + x^2 + \cdots$.
Unique Factorization: $n = p_1^{r_1} \cdots p_m^{r_m}$.

Riemann Zeta Function (for real part of s greater than 1)

$$\zeta(s) = \sum_{n=1}^{\infty} \frac{1}{n^s} = \prod_{p \text{ prime}} \left(1 - \frac{1}{p^s}\right)^{-1}, \quad \mathrm{Re}(s) > 1.$$

Geometric Series Formula: $(1-x)^{-1} = 1 + x + x^2 + \cdots$.
Unique Factorization: $n = p_1^{r_1} \cdots p_m^{r_m}$.

$$\prod_p \left(1 - \frac{1}{p^s}\right)^{-1} = \left[1 + \frac{1}{2^s} + \left(\frac{1}{2^s}\right)^2 + \cdots\right]\left[1 + \frac{1}{3^s} + \left(\frac{1}{3^s}\right)^2 + \cdots\right]\cdots$$

$$= \sum_n \frac{1}{n^s}.$$

Riemann Zeta Function (cont)

$$\zeta(s) = \sum_n \frac{1}{n^s} = \prod_p \left(1 - \frac{1}{p^s}\right)^{-1}, \quad \mathrm{Re}(s) > 1$$

$$\pi(x) = \#\{p : p \text{ is prime}, p \le x\}$$

Properties of $\zeta(s)$ and Primes:

Riemann Zeta Function (cont)

$$\zeta(s) = \sum_n \frac{1}{n^s} = \prod_p \left(1 - \frac{1}{p^s}\right)^{-1}, \quad \mathrm{Re}(s) > 1$$

$$\pi(x) = \#\{p : p \text{ is prime}, p \leq x\}$$

Properties of $\zeta(s)$ and Primes:

- $\lim_{s \to 1^+} \zeta(s) = \infty$, $\pi(x) \to \infty$.

Riemann Zeta Function (cont)

$$\zeta(s) = \sum_n \frac{1}{n^s} = \prod_p \left(1 - \frac{1}{p^s}\right)^{-1}, \quad \mathrm{Re}(s) > 1$$

$$\pi(x) = \#\{p : p \text{ is prime}, p \le x\}$$

Properties of $\zeta(s)$ and Primes:

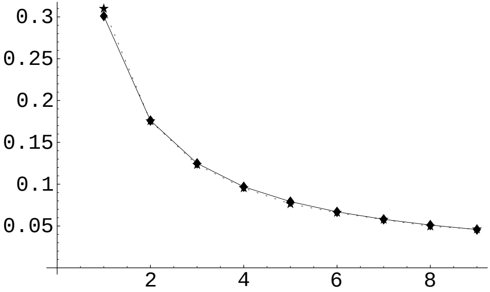
- $\lim_{s\to 1^+} \zeta(s) = \infty$, $\pi(x) \to \infty$.
- $\zeta(2) = \frac{\pi^2}{6}$, $\pi(x) \to \infty$.

The Riemann Zeta Function and Benford's Law

$$\left|\zeta\left(\frac{1}{2}+\mathrm{i}\frac{k}{4}\right)\right|, k \in \{0, 1, \dots, 65535\}.$$

The Riemann Zeta Function and Benford's Law

$$\left|\zeta\left(\frac{1}{2}+i\frac{k}{4}\right)\right|,\ k \in \{0, 1, \dots, 65535\}.$$



First digits of $\left|\zeta\left(\frac{1}{2}+i\frac{k}{4}\right)\right|$ versus Benford's law.

Proof Sketch: 'Good' L-Functions

We say an L-function is *good* if:

- Euler product:

$$L(s,f) = \sum_{n=1}^{\infty} \frac{a_f(n)}{n^s} = \prod_p \prod_{j=1}^{d} \left(1 - \alpha_{f,j}(p) p^{-s}\right)^{-1}.$$

- $L(s,f)$ has a meromorphic continuation to $\mathbb{C}$, is of finite order, and has at most finitely many poles (all on the line $\mathrm{Re}(s) = 1$).

- Functional equation:

$$e^{\mathrm{i}\omega} G(s) L(s,f) \ = \ e^{-\mathrm{i}\omega} \overline{G(1-\overline{s}) L(1-\overline{s})},$$

where $\omega \in \mathbb{R}$ and

$$G(s) \ = \ Q^s \prod_{i=1}^{h} \Gamma(\lambda_i s + \mu_i)$$

with $Q, \lambda_i > 0$ and $\mathrm{Re}(\mu_i) \geq 0$.

Proof Sketch: 'Good' L-Functions (cont)

- For some $\aleph > 0$, $c \in \mathbb{C}$, $x \geq 2$ we have

$$\sum_{p \leq x} \frac{|a_f(p)|^2}{p} \ = \ \aleph \log\log x + c + O\left(\frac{1}{\log x}\right).$$

- The $\alpha_{f,j}(p)$ are (Ramanujan-Petersson) tempered: $|\alpha_{f,j}(p)| \leq 1$.
- If $N(\sigma, T)$ is the number of zeros ρ of $L(s)$ with $\mathrm{Re}(\rho) \geq \sigma$ and $\mathrm{Im}(\rho) \in [0, T]$, then for some $\beta > 0$ we have

$$N(\sigma, T) \ = \ O\left(T^{1-\beta\left(\sigma - \frac{1}{2}\right)} \log T\right).$$

Known in some cases, such as $\zeta(s)$ and Hecke cuspidal forms of full level and even weight $k > 0$.

Log-Normal Law (Hejhal, Laurinčikas, Selberg)

Log-Normal Law

$$\frac{\mu\left(\{t \in [T, 2T] : \log|L(\sigma + it, f)| \in [a, b]\}\right)}{T} =$$

$$\frac{1}{\sqrt{\psi(\sigma, T)}} \int_a^b e^{-\pi u^2/\psi(\sigma,T)} du + \text{Error}$$

$$\psi(\sigma, T) = \aleph \log\left[\min\left(\log T, \frac{1}{\sigma - \frac{1}{2}}\right)\right] + O(1)$$

$$\frac{1}{2} \le \sigma \le \frac{1}{2} + \frac{1}{\log^\delta T}, \quad \delta \in (0, 1).$$

Result: Values of L-functions and Benford's Law

Theorem (Kontorovich and M–, 2005)

$L(s,f)$ a good L-function, as $T\to\infty$, $L(\sigma_T+it,f)$ is Benford.

Ingredients

- Approximate $\log L(\sigma_T+it,f)$ with $\sum_{n\le x}\frac{c(n)\Lambda(n)}{\log n}\frac{1}{n^{\sigma_T+it}}$.
- study moments $\int_T^{2T}|\cdot|$, $k\le\log^{1-\delta}T$.
- Montgomery-Vaughan: $\int_T^{2T}\sum a_n n^{-it}\overline{\sum b_m m^{-it}}dt = H\sum a_n\overline{b}_n + O(1)\sqrt{\sum n|a_n|^2\sum n|b_n|^2}$.

Results: Explicit L-Function Statement

Theorem (Kontorovich-Miller '05)

Let $L(s,f)$ be a good L-function. Fix a $\delta \in (0,1)$. For each T, let $\sigma_T = \frac{1}{2} + \frac{1}{\log^\delta T}$. Then as $T \to \infty$

$$\frac{\mu\left\{t \in [T,2T] :\ M_B\left(|L(\sigma_T + it, f)|\right) \le \tau\right\}}{T} \to \log_B \tau$$

Thus the values of the L-function satisfy Benford's Law in the limit for any base B.
